TALK BACK

Safe-Driving Tips Appreciated

I ENJOYED particularly "How to Drive and Stay Alive" [Aug.]. I'd like to suggest equipping cars with a small bazooka firing rearward to dispose of the motorist (or tractor-trailer driver) who stays 25 feet behind when you're on a turnpike doing the legal limit.

George Strasser, Brooklyn.

. . . I've driven for quite a few years, yet I learned a lot from your safe-driving

tips.

In fact, those 14 commandments for survival would save so many lives they should be published as a text for high-school drivers' courses. The students certainly would be impressed by a race driver who would drive 45 m.p.h. in a 50-m.p.h. zone because his cone of safety had been narrowed.

Thank you again for giving my family and myself some added safety and, quite possibly, added years of life.

L. C. VERSTYNEN SR., Rockford, Ill.

Love That Workbench Blueprint

We take off our hats to your new idea of the free blueprint ["Exciting New Split-Level Workbench," Sept.]. It is great! We hope to see more of them.

THE KONIOR FAMILY, Hartford.

Not All Sea Salts Are Salt

The bit on desalting water in "The Month in Science," [Aug.] was very interesting to me since, as patent attorney, I prepared the patent application on the process for the Department of the Interior. The inventor was the late, world-renowned chemical engineer, Dr. W. L. Badger.

You say that salt is added as a sludge to the evaporators and that the sea salt crystallizes around this added-salt nucleus. What is added is not salt (NaCl), but the sludge that forms on evaporation surfaces before the more soluble sea salts are deposited. This sludge is a mixture mainly of calcium carbonate, magnesium hydroxide and calcium sulfate. The hard, rock-like deposit formed on the evaporator surfaces by these compounds cuts down heat transfer. This was the stumbling block in previous sea-water evaporation systems.

The sea salts precipitate harmlessly on the sludge nucleus, instead of on the evaporator surfaces.

ERNEST S. COHEN, Silver Spring, Md.

Mushrooms Mushroom All Over

THERE'S something new around here.
This summer's heat and humidity have caused a lot of mushrooms to sprout out of some of my neighbors' wall-to-wall carpeting.

I took this picture of a mushroom growing out of my bathroom floor where the inlaid linoleum meets the wall.

What can we do about it?

STEWART ROUSE, Lewisville, Ind.

Try a dehumidifier. Or go into the mushroom business.

A Blast at the Tucker

FRED FETNER ["PS Readers Talk Back," Aug.] must have been reading old Tucker ads. In no other way could he soak up such a mass of misinformation!

Of the 49 Tuckers—hand-built at enormous cost—none had fuel injection, electronic ignition, four-wheel hydraulic drive, automatic transmission, or airplane brakes, although these had been promised by the visionary Tucker advertising.

The four-speed transmissions were reworked Cords with electric gearshift. The

WILL YOU INVEST 10 MINUTES A DAY to Step Up Your Earning Power?

Read about a remarkable new Success Program that is helping thousands of men to qualify rapidly for executive positions and greatly increased income. It comes to you in easily-mastered monthly kits . . . at amazingly low cost.

NOW, in your own home, you can master the fundamentals of success — pave the way to a richer life for yourself and your family. You can benefit from the most practical, scientific plan ever devised to help men increase their earning power. Others have paid hundreds of dollars to learn the tested and proven success secrets available to you in this Program in your spare minutes — at a cost of only pennies a day.

The Nelson Doubleday PERSONAL SUCCESS PROGRAM

Month by month, the Nelson Doubleday Personal Success Program will show you how to develop the basic executive abilities that pay such handsome dividends today. One by one you'll acquire the important skills that mark "the man on the way up" — skills in getting along with people — creating new ideas — understanding business figures — winning new friends wherever you go — speaking in public — organizing your time efficiently — writing business letters, reports and memos.

You start with a remarkable memory trainer. Then every 30 days you will receive a new self-training Progress Kit on an es-

sential success subject.

There has never been anything like these "Progress Kits" available — for completeness, authority and detailed step-by-step guidance. Nothing has been left out. The expert business leaders, psychologists and educators who planned the Program have included all the know-how and actual practice you need. Their simplified new self-instruction method enables you to gain "practical experience" in the odd moments that now go to waste.

Sample "Memory-Trainer" Kit only 104

To introduce you to this new kind of personal achievement plan, Nelson Doubleday offers you a valuable "sample kit" almost as a gift. You'll receive a remarkable 10,000 word handbook — How To Remember Names and Faces — that gives you the secrets of professional memory experts. In the first five pages you'll learn one easy trick that will double your memory power — overnight. Soon your new "automatic memory" will win new friends, gain recognition on the job.

As with each Progress Kit in the Program, a set of practice and application cards accompanies the memory handbook. Slip them into the pocket case provided – for use in your spare moments. They've been planned to add a "real life" dimension to self-instruction.

Along with your memory training material - as an extra bonus to launch your own Success Program - you will receive a self-evaluation Aptitude Test.

There's Plenty of Room "At the Top"

Leaders are sought and welcomed more than ever in the business world today. To begin qualifying, accept the valuable introductory package offered by the Personal Success Program for only 10¢. There is no obligation whatever — and no salesman will call. This is merely a "demonstration offer."

If you are delighted with your first kit and wish to continue with the Program, you will receive a new Progress Kit each month, for which you will pay - not the many dollars charged by most "schools" - but only \$1 plus small shipping cost. You stop whenever you like. Mail the coupon today. The Nelson Doubleday Personal Success Program, Garden City, N. Y.

Put Yourself in This Picture of Success

A fine car ... mency in the bank ... and above all, that wanderful feeling of security—these are some of the rewards of executive success. There is so much you can provide for yourself and your family ... an assured college education for the children ... trips abroad ... time and maney for your feverite hebbies ... prestige in your community.

Stop drawning about the good things of life — make them yours! This new Personal Success Program offers you the most practical short cut to higher earnings

ever devised.

SEND ONLY 100 TODAY — STOP WHEN YOU LIKE

Try This Interesting Demonstration for only 10¢

1. "HOW TO REMEMBER HAMES AND FACES"—the self-instruction handbook that increases your memory power up to 500% in a few weeks. You pessess a skill that's worth a million when you can instantly recall names, focus, facts.

2. POCKET-TRAINER MEMORY CARDS — on exclusive feature of the Personal Success Program that allows you to sharpen your memory with inconspicuous "real life" prostice anywhere. Handy pocket holder included.

3. NANDSOME DESK FILE shown at the right, for convenient storing of your Progress Kits.

4. FREE BONUS GIFT: Sulf-Scoring APTITUDE TEST

Complete 32-page self-evaluatar that scientifically reveals to you — and you alone your present aptitudes, vocational interests, and "hidden potential."

Halson Doubleday Personal Success Program Dept. 9-PS-X, Garden City, New York

I enclose 10 cents to help cover shipping charges. Send me at once my introductory package containing 1) handbook "How to Remember Names and Faces" 2) practice and application cards, plus pocket Card Holder 3) handsome desk-top File Case and 4) self-scoring Aptitude Test.

After examining this package, I will decide whether or not I wish to continue. If not, I will simply let you know. If I do continue you will send me a new Progress Kit each month for only \$1 plus shipping. I am not obligated to take any minimum number of kits, and I am free to stop at any time.

HAROLD E. GLOVER, Minneapolis.

More Light on Lightning

I FOUND "The Awesome Miracle of Lightning" [Aug.] helpful. It points out the usefulness of the phenomenon and explains how it occurs. But I was left with a troublesome question.

The author asserts, as others do, that lightning actually goes up. This I can understand, or could, until he later says that the lightning bolt travels from out-

side a building into it; travels along the ground, ripping a trench, knocking a hole in the basement wall and doing other such destructive damage. This seems to contradict the statement that it travels upward.

OTIS G. CARNES, Fayette, Mo.

Lightning is a complicated phenomenon. It might be more accurate to say that intense electrical fields are set up. Where these fields overcome natural resistance to the passage of electricity, current flows. The currents could go out of a house as well as into it, along the ground or a fence, or anywhere else, depending on the nature of the field and the material.

The main current of lightning, however, follows an upward direction in general, as our article stated.

our family? About a month ago lightning struck our house (one of the tallest in the vicinity) and knocked the chimney off. At the same time, the TV set stopped and required repairing. Ever since, we have shut off the TV when there is a lightning storm. Was the lightning attracted to our house because the TV was turned on?

GERRY KALYNIUK, Winnipeg, Can.

Having your TV turned on would make no difference. The antenna mast should be grounded, however, and a lightning

If your heart is set on a larger income and all that it means ... better home-fine car-larger bank account-more of the good things of life....

If that's your ambition and you are really serious about it, then you owe it to yourself to get the REAL FACTS about LaSalle Accounting, and the many good-pay opportunities that can be YOURS through LaSalle's famous Problem Method plan.

It matters not whether you've had a single day of experience in this field—or whether you have already started but want to climb higher, LaSalle's expert training is designed to take you from where you are...to where you want to be... in higher positions and a lifetime career of security and good income.

WHY YOU CAN'T FAIL TO GAIN

You see on this page a panel of experts who know Accounting from A to Z...all the way from Basic Accounting on up through Accounting Systems, Cost Accounting, Auditing, Federal Income Tax, and training for the CPA certificate. These are only part

of our instruction staff. But what is most important to you ... These CPAs and Expert

Accountants know how to impart their knowledge to others . . . how to help you prepare quickly yet thoroly for success in this lucrative field.

The proof? What stronger proof could there

be than that more than 4,500 Certified Public Accountants (one out of every 13 of the U.S. total) has trained with LaSalle? Or the hundreds of thousands of men and women whom LaSalle has helped qualify rapidly for more money, a brighter future, in a highpay-lifetime career? These thousands came to us with different backgrounds of experience and varying degrees of ambition. Many have reported raises and promotions after only a few weeks of training. Thousands of them have written to say they are now earning 50% more-even double their former incomes—often in less than a year. These letters are published in book form for your inspection. They were written by real people, with real income problems and ambitions—people who might be your next-door neighbor.

Yes, if you are really sincere in wanting to better your position start your income climbing —enjoy a lifetime career of high standing and high reward—this friendly staff of experts can help you.

propore for fost promotions and bigger pay. They can do the same for youl

SAMPLE LESSON SENT FREE MAIL COUPON BELOW

You don't have to wonder what LaSalle's Accounting plan is like, You will be sent a free sample lesson, which does not obligate you in any way, Study it-keep it -see for yourself how simple, clear, and easy it is to master. This is an actual lesson right out of the regular training-to show you exactly how LaSalle's Problem Method has trained more than 1,400,000 men and women from all walks of life.

Also...the latest book, "Op-portunities in Accounting," gives all the latest facts about the new and growing opportunities in several different fields of profitable employment.

This can be an important day in your life. A coupon like the one below has started hundreds of thousands of men and women toward a bigger job, a larger income. It can do the same for you.

THAT BETTER JOB or A BUSINESS OF YOUR OWN is within your reach. Opportunities are plantiful in the air conditioning and refrigeration field. Although old and established, this industry is booming. Today, over 150 million units are in use. Last year, 3 million refrigerators, 1 million freezers and two million air conditioners were sold.

THOUSANDS OF MECHANICS ARE NEEDED to keep these units in working order. Trained men earn up to \$150 a week and more... and work steady. So, why saddle yourself with low income when you can enjoy a better job, better pay, better living? To find out how, just fill out and mail coupon. Do it now.

CTL TRAINS YOU AT HOME IN A FEW MONTHS

You get practical training along with real experience because CTI sends you 25 big hits. You assemble a heavy-duty, commercial-type, ¼ h.p. high-side (illustrated above). You run many tests, do 10 complete trouble-shooting and repair jobs. You build and keep an air conditioner, freezer, refrigerator or milk cooler. Only CTI sends you this equipment—at no extra cost. Easy picture lessons make training easy.

EARN CASH AS YOU LEARN

Soon after you enroll, use your newly-acquired skill to do repair jobs in your community. Earn extra cash. Some students make up to \$15 a week and more—others open a shop. Mail coupon newl—Commercial Trades Institute, 1400 Greenleaf Ave., Chicago 26.

A Vote Against Lube-Free Cars

Designing "Cars That Never Need a Grease Job" [Sept.] seems like a good idea at first thought. My experience in the garage business, however, is that some moves in this direction have turned out badly for car owners,

Take the sealed ball bearings now widely used for rear wheels. One friend had the rear quarter of his car catch fire

due to sealed-bearing failure. Another, learning of this, installed new rear-wheel bearings as preventive maintenance—and none too soon at 85,000 miles, for his old bearings were dry. A third had rear-wheel-bearing failure at only 46,000 miles.

I think Detroit should build cars for careful, sensible owners. These "peopleproof" sealed bearings prevent them from getting maximum service, because sensible care is made impossible.

R. S. Morrison, Delta, Utah.

Dice Make Nice Table Top

IN YOUR "PS Readers Talk Back" section [Aug.] Rubin Levine, Las Vegas, wants some use for discarded dice. They make a nice table top, either sawed in half or used whole.

H. N. GAY, Wichita Falls, Tex.

... In my younger days we made some nice-looking rings from dice. They should go well in Las Vegas,

M. J. Prease, Villa Park, Ill.

... Has Rubin Levine thought of drilling holes in his salvaged dice and wiring them together to form a trivet or plant stand? Or he might cement them to squares of plywood.

JAY ALCOTT, Philadelphia.

Just Don't Drive in the Rain

May I put in a word about horizontal windshield wipers ["New Ideas from the Inventors," Aug.]. These may wipe

Invitation to Thieves?

A WORD of caution on transparent mailhoxes [I'd Like to See Them Make. Aug.]. They're an open invitation to mail thieves—especially with government checks. A thief could spot the dis-

tinctive brown envelope (showing the green check through its window) from the sidewalk

FRED H. BACKSTROM, Springfield.

AMPle Explanation

When describing his experiences ["I Lied to a Lie Detector," Aug.], Wesley S. Griswold refers to "just a few millivolts." Since he's speaking of electrical current, this should read "milliamps," Volts are not a measure of current.

R. B. BATTIN, Cocoa Beach, Fla.

Saving Dollars with a Small Car

Your discussion on "What You Save with a Small Car" [Aug.] missed up on one advantage that's really appreciated by people who drive into the city often.

Before I bought my Renault I'd never dream of driving into downtown Boston expecting to find a parking space. I paid from \$1 to \$2 to some lot owner so that I could park my ark from Detroit.

Now that I own a small car, parking fees run to nickels. There always seems to be a spot at a meter that is just big enough for my Renault. I estimate that in the past eight months I've saved between \$50 and \$60—quite a substantial saving and one that should be added to your list.

C. L. GOULSTON, Dorchester, Mass.

Size Caused Buick's Stump?

THE reason for Buick's slump ["Detroit Report," Sept.] wasn't its conservative appearance. The car was, in fact, coarse, over-chromed, and massive, and looked big for the money. It was purchased not by doctors, but by less-affluent status seekers.

NEW Low-Priced Dodge Dart Features Revolutionary All-WELDED Unibody Construction

Roominess and riding comfort took a big step forward with the announcement of the new low priced Dodge Dart. The more efficient one piece Dart Unibody scored a major breakthrough in boosting interior room and

comfort by eliminating space wasting side rails and crossmembers. Strength and durability are integrated into the body itself. Conventional squeak and ratile-causing attachment of body to external frame eliminated.

Notice how new integrated strength puls more usable space inside. There is more room for feet, hips, shoulders, hats. Seats are deeper, thicker, Doors are bigger, open wider.

Long lasting beauty and a higher tradein value are assured by 7 separate rust preventive dippings, four sprayedon coats of primer and Lustre Bond enamel for a tough fade-free linish.

In conventional body frame design strength is concentrated in the frame Weak body is subject to squeaks, raftles, unibody equalizes the strength through the entire structure. Body squeaks and rattles are a thing of the past.

ACCREDITED MEMBER NATIONAL HOME STUDY COUNCIL

When the 59s came out, they looked no larger than a Chevrolet and not as daring, so the status seekers—Chevy graduates—went to Pontiac and Olds.

P. A. VANCE, Columbia City, Ind.

Rockets Vs. Bullets

MUCH of what you say about the crack-down on amateur rocket shoots ["The Month in Science," Sept.] is true. I've built and fired about 100 small, solid-propellant rockets. If you are careful, this is no more dangerous than deer hunting; less so—the "woods" aren't full of other rocketmen.

HARRY NEUMAN JR., Traverse City, Mich.

On Removing a Floor Board

That easy way of replacing a board in a floor [Aug., p. 167] needs qualification. A nail-cutting blade in an electric handsaw will cut through the tongue of the damaged board and the nail only if regular steel nails were used in the flooring. If hardened-steel, helically threaded nails were used, the metal-cutting blade won't do the job.

R. C. Honge, Cambria, Va.

A Photo Fan Speaks Up

MY THANKS for the fine article, "The Way I Shoot Motorcycle Races" [Aug.].

As an amateur photographer, I found it very valuable. How about some more articles on photography?

RICHARD BAUMAN, So. El Monte, Cal.

Two Engines Missing

"THE Outfit Where Everybody Jumps" [Sept.], shows a picture of a squadron of two-engine Air Force transports on the ground. You call them Hercules C-130s, Isn't the Hercules a four-engine turbo-prop?

FREDERICK LEE, NYC.

A blushing "yes." The planes shown are Fauchild C-123 Providers, powered by two conventional piston engines.

Now-handiest tool Do 101 jobs with the blue-hot

Five minutes after you use this new tool you'll wonder how you ever did without it!

Now, with the flick of a match, you install asphalt tile, thaw frozen pipes, solder tools and toys, remove old paint, solder copper tubing — do hundreds of jobs around your home — with the easy-to-use Bernz-O-Matic Torch!

There's no filling! No spilling! No pumping! No priming! Just screw the burner unit onto the safe UL-approved, disposable fuel cylinder — and your Berns-O-Matic Torch is ready! It lights instantly!

And every job you do . . . like antiquing furniture . . . costs you only pennics. A Bernz-O-Matic fuel cylinder lasts up to 15

hours with pencil-type flame. Replacement cylinders available from any hardware store. Cost only \$1.94.

Torch units like the one shown above are \$6.95. Torch kits with soldering tip, utility burner and flame spreader — or a complete kit with sturdy metal carrying case and handy sparker — are also available . . . up to \$9.95.

Ask your hardware dealer to demonstrate the most do-everything tool since your electric drill... The Bernz-O-Matic Propane Torch. And while you are there, be sure to enter your name in the big Family Sweep-stakes of 1001 Prizes.

REMOVES PAINT

CHARCOAL FIRES

Small change is getting scarce. You can blame it on taxes (more city and state sales levies), automation (more vending machines and parking meters), and sales psychology (more tags that say \$19.98).

The Denver Mint, which stamps out \$160,000 a day in pennies and nickels, has gone on two 10-hour shifts. The problem is further complicated by strike-caused copper shortages. Pennies are 95 percent copper; nickels 75 percent.

The last time a copper shortage threatened coin production was during the war. The mints made steel pennies then.

The major "cost" of making money is the metal itself. A pound of copper (worth about 30 cents) yields 145 pennies; an ounce of silver (90½ cents) may end up as \$1.38 worth of dimes, quarters, or half-dollars. Silver dollars haven't been made since 1935. But there's no shortage: The Denver Mint has 30 million of them tucked away.

Flown in a jet yet? Chances are you will—if a "long journey lies in your future." Jets have boosted air travel to an all-time high. Air now beats sea as the path to Europe and back (568,000 air passengers in the first half of '59 compared with 375,000 sea voyagers).

"Economy" flights have helped, officials say, but the real spurt comes from the jets. Their time-shrinking charms appeal to a vast new market: people who've never flown before. The load factors tell the story. They're the percentage of available seats that are occupied. For piston planes, load factor is up to 60 percent; for jets it's a whopping 90.

The jet story gets even better with a pat on the back from the Federal Aviation Agency: Jet engines are proving to be 20 times more reliable than piston engines.

The Agency studied the Boeing 707s used by Pan American in its transatlantic flights, and by TWA domestically.

In 10 months Pan Am's jets clocked 64,000 engine hours in service. There were only five "precautionary" shutdowns. TWA's record for five months and 48,000 engine hours was only two shutdowns. Neither airline reported any case of engine fire.

Some of the reasons the engineers give for the greater safety are:

- Simplicity: There are fewer parts, fewer controls to keep track of.
- Wing-suspended engines: Fire hazard is cut by 60 percent.

...have you heard...?

By the end of 1960 there'll be 300 jets in world-wide service (excluding Russia's). One jet can carry as many passengers in a year's time as the Queen Mary. Net result? Not only will you fly a jet yet—but most likely at a lower fare.

If you take a radio along, don't count on listening while you're in the air. The international airlines won't let you turn it on during a flight. Reason? Some sets interfere with a plane's electronic gear.

One AM-FM portable, when switched to FM, upset the pilot's VOR navigation receiver so badly that he couldn't rely on readings when he was more than 25 miles out. But almost any of the communica-

tions, navigation or integrated flight-instrument systems aboard can be affected. The needles jiggle and the pilot can't tell whether he's heading the right wayor even if he's flying level.

Interference comes from electromagnetic radiation—radio waves—that all electronic devices produce. Transistor portables are the worst offenders, say the aviation officials. Their circuits are often marginally stable and quick to slip into oscillation.

The ban against playing radios also applies to all other kinds of personal electronic gear with one exception: Hear-

ing aids are okay.

So far an official rule has been adopted only by international lines. But domestic operators have been urged to enact a similar prohibition.

Who owns foreign cars? Tracing 10,000 purchasers of foreign cars, the National Automobile Dealers Association found that:

Financially, they're a pretty well-fixed group. Half make under, half over, \$8,000 a year.

Nonetheless they bought imports for economy's sake. Average "small car"

price was \$2,196. Gas economy was cited by 88 percent as their prime motive.

They're well educated, Only three percent failed to attend high school; 69 percent spent some time in college. They're young, too. Average age was 37.

For the majority (58 percent), the import was not a second car, And 86 per-

cent said they'd buy foreign again.

Yes, Smell-O-Vision is here. Film makers have toyed with ways to add smell to sight and sound in movies for years. Now Michael Todd Jr. thinks he has the answer. He's chosen the name purposely, he says, "to get the jump on these who will call it that anyway."

The new process will perfume the film, "Scent of Mystery," to open at a special theater in Chicago. A magnetic track on the film will synchronize action to an "odor machine." Individual odor outlets fixed into each seat will guarantee that the whole audience knows the picture smells.

The odors—all 40 of them—are keyed to scenes varyingly humorous, romantic or suspenseful. The process is a 20-yearold development of a Swiss scientist.

What next? "Feelies"?

20 POPULAR SCIENCE NOVEMBER 1959

WHAT DOES THE LARK HAVE THAT THE OTHERS DO NOT?

PROVEN BY 750,000,000 MILES OF CARFFREE OWNER USE. All over the United States more than 100,000 Americans have been driving their Larks under every conceivable condition of road and weather. Lark repair and maintenance costs are considerably below the automobile industry average. Proof that The Lark is rugged!

POTENT PERFORMANCE, EXTRA ECONOMY Zero to sixty in 9.5 seconds with The Lark V-8 and 4-barrel carburetor. 22 28 miles per gallon of regular gas with the V-8 in last year's Mobilgas Economy Run. Naturally the "Six" does even better. Take your choice!

SIX BODY STYLES: the world's only full line of new dimension cars... Convertible, Hardtop, 4-Door Station Wagon, 2-Door Station Wagon, 4-Door Sedan, 2-Door Sedan. Who else has them? And with pleated vinyl or fabric upholstery and new sophisticated colors!

CO. BARRINGTON, NEW JERSEY

The month in science

Rocket fuel, 423 degrees below zero. A bright high-school chemistry student could have told the Air Force that the best fuel for rockets is liquid hydrogen. The only trouble was nobody had ever made it by the ton.

Now Air Products, Inc., rolls big vacuum-bottle trailers of the cold and touchy stuff-many tons every day-out of a Florida plant that qualifies as one of the world's strangest factories.

Hydrogen possesses two unsurpassable advantages:

It is the most powerful chemical fuel by far, producing twice as much energy as its closest competitors (beryllium and boron).
 It is the lightest substance there is. A gallon of liquid weight half a pound.

Combined, these facts mean that rockets using hydrogen can carry bigger payloads farther. The ideal chemical rocket would burn hydrogen with ozone (the form of oxygen that has three atoms in each molecule instead of the ordinary two). This combination promises a 50-percent boost in performance over lox-kerosene. Even atomic rockets would use hydrogen for the "working fluid," the stuff that gets heated by the atomic furnace and shot out the back to send the rocket forward.

There are also two troubles with liquid hydrogen:

1. It is such a good fuel that it explodes quite readily.

2. It is so cold (minus 423 degrees F.), if put in a metal can, air would freeze solid on the outside. Only liquid helium is colder.

The Florida factory makes hydrogen gas out of crude oil, which is mostly hydrogen and carbon atoms joined into various compounds. The oil is burned to generate hydrogen gas, plus carbon dioxide and carbon monoxide. The carbon monoxide makes

additional hydrogen by combining with steam, taking the oxygen atom out of the H₂O (to become carbon dioxide) and leaving the hydrogen free.

The month in science

The hydrogen goes through several complex processes to come out the purest ever made-in trade jargon between "six and eight nines," that is, between 99.9999 percent and 99.999999 percent pure. Yet even 100-percent hydrogen wouldn't be good enough because there are two forms of hydrogen molecules. The two atoms that make up a molecule of hydrogen spin, like tops. In ortho hydrogen, both atoms spin in the same direction. In para hydrogen, the atoms spin in opposite directions. This wouldn't matter except that after hydrogen is liquefied the orthomolecules gradually change over to para. When that happens, heat is released. A tank of liquid hydrogen, even if perfectly insulated, would generate so much heat from the ortho-para conversion that the liquid would boil into a gas again. To make sure that the liquid stays liquid, all ortho molecules must be converted to para by running the gas over a chromium oxide catalyst.

Several steps convert the gas into liquid. First it is compressed and cooled with water. Then it's cooled with liquid nitrogen (-320 degrees). The very cold gas is finally allowed to expand in gigantic high-speed turbines. Spinning the turbine wheels uses up energy, which comes from the heat of the hydrogen gas. The temperature of the hydrogen plummets below -423 degrees and it condenses to liquid.

First use of liquid hydrogen will probably be in an engine that Pratt & Whitney is developing for Convair's Centaur. Boosted by an Atlas first stage, Centaur should be able to orbit a satellite weighing four tons.

The Pied Piper of Great Bend, Kan. Modern scientists can orbit satellites, bounce messages off the moon and navigate ships across the ocean underneath the icecap, but when it comes to something really useful like getting rid of starlings, they're stuck.

Starlings are glistening, blue-black birds that roost by the tens of thousands in residential areas in and around cities. Like the humans who live there, they swarm off in the morning to pick up a living and swarm back at night. They produce enough guano to fertilize a plantation. Not even birdlovers love them.

Scarecrow tactics-stuffed owls, shiny aluminum reflectors-don't faze the birds. A real scientific dodge-tape-recorded distress calls that the star-

lings themselves use to warn the flock to get away from danger -looked promising, but failed, too. The birds just moved over a block or two.

Last summer starling-plagued Mt. Vernon, N. Y., called in a modern Pied Piper. Spry, diminutive Otto D. Standke has chased the starlings from the park in his home town of Great Bend, Kan., as well as from the Federal Buildings in Indianapolis and Louisville. Smoking his cigar, banging aluminum paddles, and intermittently striking a chime hung round his neck, Standke strode Mt. Vernon's streets. The starlings took flight. But they came back.

LAW

TRAINING

for

BUSINESS

[in spare time at home]

Earn LL.B. Degree

Thousands of men and women who never intend to practice are studying Law in spare time at home-not for a legal career but as an aid to business advancement.

Law today is involved in almost every major business decision. In many lines of work it is almost indispensable—credits and collections, accounting, traffic and transporation, employee relations, real estate, insurance, finance, taxation, etc. For all types of work, Law training develops keen, clear, quick, correct, and decisive thinking.

You can study LaSalle's American Law and Procedure right in the privacy of your own home—progressing as rapidly as your time and ability permit. LaSalle has, for over 50 years, helped more than 1,400,000 ambitious people get ahead in the business world. Thousands of letters in our files from grateful atudents and businessmen who have achieved greater success speak of—better jobs, more money and the natisfaction it brings, prestige and leadership.

A MOST UNUSUAL LAW LIBRARY

This training includes the fourteen-volume LaSalle Law library—AMERICAN LAW AND PROCEDURE, which is the basis of all the instruction service. This library has been compiled by leaders in the field of Law. It covers the whole basic field of Law in an orderly and simple manner that is easy to learn and understand. Collateral reading and printed lectures on legal problems which are furnished at regular intervals throughout the training, supplement the text. Law instructors personally supervise your program from the first assignment to the LL.B. degree or diploms. Under the LaSalle method you deal with legal problems—you learn by doing—actu-

ally solving legal problems—not just memorizing rules.

WRITE TODAY FOR TWO FREE BOOKS

You are determined to get ahead—to prepare for greater future possibilities—and to earn more money. Send the coupon below and find out how to qualify yourself for the many openings available to the Law-trained man. In our FREE books, "Law Training for Leadership" and "Evidence," you will find answers to all your questions about the study of Law and the LaSalle method.

No investment is bicely to pay higher returns than an investment in yourself, by enrolling in the American Law and Procedure training. Send coupon today for full information—no obligation, of course.

38 POPULAR SCIENCE NOVEMBER 1959

Shrinks Hemorrhoids New Way Without Surgery Stops Itch — Relieves Pain

For the first time science has found a new healing substance with the astonishing ability to shrink hemorrhoids and to relieve pain—without surgery.

In case after case, while gently relieving pain, actual reduction (shrinkage) took place.

Most amazing of all—results were so thorough that sufferers made astonishing statements like "Piles have ceased to be a problem!"

The secret is a new heating substance (Bio-Dyne*)—discovery of a world-famous research institute.

This substance is now available in suppository or cintment form under the name Preparation H.* Ask for it at all drug countersmoney back guarantee. *Reg. U.S. Pat. Off.

Free Plans from Masonite for your favorite christmas figures

Decorate your yard and your home with bright, colorful Christmas figures. It's easy and fun with our free plans and sturdy Masonite" hardboard panels. Make a jolly Santa...his prancing reindeer...a Nativity scene...choirboys, carolers, angels...and a dozen other joyous themes.

You don't have to be an artist! The plan folder explains all: how to make the cutouts any size you like, what colors to paint them, how to stand them in the ground or attach them to the house. You'll like working with sturdy, split-proof Masonite panels, too. They're smooth and grainless, without knots. They take paint or enamel beautifully. And they'll laugh at the weather for many Yule-tides to come.

See your local lumber dealer today for your free Christmas plan. Many are offering special prices on Masonite panels in sizes 1' x 4', 2' x 4', 3' x 4' and 4' x 4'. Or send the coupon today—we'll rush the free plan folder to you.

7 POPULAR SCIENCE NOVEMBER 1959

SEE IT! PLAY IT! 5 DAY FREE HOME TR

You're invited . . . to join in the fun along with all Americal Here's the newest, most desired musical instrument sensation-the Philharmonic Chord Organ! You play it without lessons, without practice . . . it's so easy you won't believe it until you try it! Discover the thrill of actually playing a musical instrument.

Entertain others . . . bring the family closer together. Best of all, you buy direct from the importer at big discounts . . . actually SAVE 1/2 off mfr's list price. You deal direct with largest firm of its kind in the world! You don't need much cash . . . just a little down and the rest in small monthly payments.

Your Philhermonic Chord Organ comes from Italy...

largely handcrafted by skilled organ builders, Unlike most domestic-made Chord Organs with inferior plastic reeds, your Philbermonic creates threlling tonal color and beauty, thanks to its fine Swedish Stainless Steel reeds, each carefully matched and tuned. Many models available in wide selection of fine woods and finishes.

TRY THE PHILHARMONIC IN YOUR OWN HOME FOR FIVE FULL DAYS FREE TRIAL PLAY ITI ENJOY IT! See how much fun and accomplishment it brings. Lightweight, fully portable. DOUBLE GUARANTEED. Get FREE Color Catalog and low Importor-to-you discount prices . . . Rush Coupon.

Helps You Overcome

FALSE TEETH

Looseness and Worry

No longer be annoyed or feel ill-at-case because of loose, wobby false teeth FASTLETH, an improved alkaline (non-seed) powers, sprinkled on your plates holds them firmer so they feel more comfortable. Avoid embarrassment council by home plates. Get FASTEETH at drug counters everywhere

I'd like to give this to my fellow men... while I am still able to help!

I was young once, as you may be—today I am older. Not too old to enjoy the fruits of my work, but older in the peace of being wher. And once I was poor, despersivly poor Today almost my man can stretch his income to make orde meet. Today, there are few who hanger for broad and abelier. But so my youth I know the pinch of postery the empirees of funger; the culfi state of the creating who would not take excuses for money, Today, all that

to past. And behind my city house, my

dummer home, my Ladillaca, my Winterlong vacations and my sense of independence—behind all the wealth of each and deep loner antisfaction that I enjoy—there is one simple secret. It is this accret that I would like to impact to you, if you are actished with a hundrum life of service to another master, turn this page new read no more if you are interested in a lotter life, free from bosoes, free from marries, free from bosoes, free from marries, free from bosoes, free from marries, free from bosoes, free from

by Victor B. Meson

Out of the thousands who read this message perhaps only you and a (sw others will have the viaion and the intuition to realize that it may be intended that you read this page at this time—that the coincidence of boking this magazine in your hands may shape your deating, may guide you to lots of independence beyoud the dreams of avance.

Don't misunderstand me, I am not speaking of mysterious laws of nature that will sweep you to success without effort on your part That sort of talk is rubbish. If this message is intended for you, you are the kind of man who knows that anything worthwhile must be earned. If the earlier development of your karros has revealed to you that there is no reward without effort, you may now be ready to learn and use the secret I have to impart.

Please don't minunderstand this statement I am not a philanthropast Frankly, I am going to charge you something for the secret I give you Not a lot—but enough to convince me that you are a little above the fellows who merely "wish" for success.

I have two businesses that now pay me all the money I need, One of them is unusual in two respects 1) It is peeded in every little community throughout this country, 2) It is a business that will never be invaded by the big fellows. It is essentially a one man business and can be operated without outside help. It is good summer and winter It is growing each year. It can be started in spare time on an investment so small that it is within the reach of anyone.

When your space time business grows to the point where it is paying as much or more than your present salary, it can be expanded—overnight—into a full time business. It can give you a sense of personal independence that will free you forever from the fear of layoffs, loss of job, depressions, or economic reverses.

There are only two requirements:

1) You must have the kind of temperament that gives you pleasure from working with your hands. Two hours a day of manual work will keep your "factory" running 24 hours, turning out a product that has a ready sale and a steady sale in every community. A half dollar spent for raw materials can bring you six dollars in cash—six times a day,

There is not enough space here

to tell you the full story, but if you are interested in becoming independent in a business of your own, in knowing the sweet fruits of success as I know them, send me your name. That's all, Just Your name.

I will send you the facts that will enable you to check up on the opportunities in your own community and then if you decide to take the next step, I will allow you to invest \$15.00. Even then if you decide that your \$15.00 has been badly invested, I will return it to you.

There's no coupon on this announcement. If you don't think enough of your future to write your name on a postcard and mail it to me, forget the whole thing, but if you think that having this message come to your attention may be a coincidence that is more deeply connected to your destiny that either of in cast say, then send your name. No salesman will call on you. I will write you fully and you can then make your decision in the privacy of your own home.

Kits for Christmas GENIAC COMPUTER KIT

You can construct over 125 different circuits and machines that compute, reason solve pussion and demonstrate a wide variety of basic computer circuits with the GENIAC electric brain construction k.t. Over 30 000 schools, colleges, industrial firms and private individuals have bought GENIACS since we first brought them on the market

QUALITY Cost up to do a problem in Space Ship Engineering

We have recently added a circuit for composing music which gives us special pleasure because it was designed by a 1ft year old boy who learned about computers from his GENIAC Dozens of other youngsters have created their own designs for computing circuits used GENIACS in their school projects and established a solid foundation of information on computers with GENIACS

Each kit comes complete with Beginners Manual, Study Gulde, instructions for building all the machines and circuits rack texclusive with our GENIAC), parts tray and our com-plets question answering service. When you buy a GENIAC you are huying a first course in computer operation

Each alt comes with a one week money back guarantee if you are not satisfied.

Price of Kit complete with parts tray rack all components manuals and texts \$18.98 (postpart of U S add 60c west of Mississippi (\$2.00 outside United States.)

THE EASIEST

every automotive engineer is now studying the new Ford Falcon.

Now that the new-size cars are out, expert engineers and drivers have looked them all over—tested them on turnpikes, tortured them on high speed tracks. Here's a typical test driver comment. Don Stewart, Detroit editor of MOTOR LIFE, said, "... the Falcon is completely capable of gliding over a wide assortment of terrain. This car is no boulevard prima donna! ... Arriving at a sensible compromise between economy, passing power and sufficient weight mass, the new Falcon instills in its driver that sense of security rarely found in cars of its dimensions ..."

Front engine or rear? This debate is as old as the earliest automotive patents (back around the end of the 19th century), but for 1960 it's hotter than ever with two of America's leading car makers taking diametrically opposite positions. Ford's front-engine design has general advantages in safety and stability over rearengine cars. In addition.

1. A bigger and more convenient baggage space is an obvious advantage of front-engine cars. Wheel wells and steering column dictate small, oddly shaped baggage compartments in rear-engine cars.

- 2. In the event of a forward collision, front engine's mass absorbs impact, provides greater safety to car's occupants.
- 3. Gas tank located more safely in the rear is another front-engine advantage. Some rearengine ears have gas tanks up forward, in front of passengers.

"Do-it-yourself" simplicity. Here again Ford has taken a different route from that followed by its major competitor. The Falcon six-cylinder engine is a dependable, proven design, It

CAR IN THE WORLD TO OWN

has a single carburetor... eliminating the problem of synchronizing two carburetors. Vertically mounted for the greatest accessibility, it has a one-piece, cast-iron cylinder head and intake manifold for greatest simplicity. Servicing is a snap... no need, for example, to remove engine for valve or ring work. The Falcon Six will present no mysteries to mechanics, even the do-ityourself variety. Other Falcon advantages: selfenergizing brakes have 30 fewer parts. Fenders bolt on for inexpensive, easy replacement.

Economy and convenience without austerity. The Falcon's fresh-air, hot-water heater doesn't burn extra gas to reduce your mileage figure as do gasoline heaters. Standard gearshift lever is located conveniently on the steering column, not on the floor where it limits passenger room. Comfort features such as dual sun visors and arm rests are standard. Insulation, seat cushioning, and interior trim are considerably superior to the Falcon's nearest competitor.

The Test Program: Experience Run, U.S.A. After three years and three million miles of steady automotive sadism that put the Falcon to every test the wildest-eyed engineer ever dreamed of, Ford sped a fleet of 16 Falcons over gevery last mile of numbered Federal Highway.

The Falcon drivers, hard-nosed automotive types, sent back reports like these:

pike speeds with the automatic transmission, which is very, very exceptional.**

curves just like they weren't there. We go over the mountains and hills with terrific ease... carrying about 400 pounds of baggage and equipment in the back now. You couldn't ask for any more room."

gallon and we've been doing terrific!

What oil? This automobile doesn't use any oil. 3000 miles so far and we haven't had to hardly look at that oil stick. This engine is sensational."

"It's got plenty of power. When we came over the Continental Divide the other day you couldn't ask for any more power..."

It's a beautiful piece of engineering. Simple, clean, all automobile. Try it at your Ford Dealer's and bring the whole family. There's plenty of room for six.

THE 1960 Falcon

THE WORLD'S MOST EXPERIENCED NEW CAR

Subs Have 'Em, Why Not Cars?

Periscopes for automobiles? The American Optical Company claims significant safety advantages over conventional rearview mirrors for a periscope-type system.

Among the advantages; a field of vision more than twice as wide; no rear posts impeding the view; no blockage of vision by rear passengers, parcels on the back shelf or rain or snow on the rear window. Not suitable as an add-on accessory, the periscope must be built into a car—so it is still quite a long way from general use.

That Corvair price tag. Chevrolet's announcement that Corvair prices start at \$1,800 is misleading at the moment. This is the factory-suggested list price of a 500 Series two-door coupe. The catch: Two doors won't be offered until "sometime after the first of the year." Prices of models currently available, 500 Series and more deluxe 700 Series four-doors, are \$1,860 and \$1,920. When it comes out, the 700 coupe will cost \$1,870. These are bare, base prices, exclusive of taxes, freight and delivery charges, accessories.

Ed Cole, boss of Chevrolet, describes the two-doors still to come as "sprightly and sporty . . . not just copies of our sedens with two less doors"

sedans with two less doors."

There have been hints that an even sportier, higher-performance version of the coupe might be in the offing—something of a gran turismo model. Corvair won't offer a wagon (though Ford's Falcon will—next spring).

Gas turbines for trucks? An experimental truck developed by Chevrolet and powered by a newly designed turbine engine is so superior to a similar truck built two years ago that Chevrolet Chief Engineer Harry F. Barr terms it "a giant stride in vehicular gas-turbine development." Called Turbo-Titan II, the truck has a power plant that is 350 pounds lighter and 25 inches shorter than the earlier version, uses 25 percent less fuel, and provides 12½ percent more power.

Quicky oil test. A simple test to determine the condition of a car's engine oil is being tried out in a few Shell gas stations.

A drop of oil is placed on a piece of neutral filter paper and allowed to spread for 60 seconds. The "oilprint" is compared with others in a manual to check the oil's characteristics. The test would prevent over-long use of oil—with possible engine damage—and unnecessary oil changing.

See Why New LOW PROFILE SHAPE Tires

KEEP YOU SAFE WHILE THEY SAVE YOU MONEY!

U.S. Royal's radically new tires run cooler, are safer, give up to 35% more mileage, save gas—yet cost no more!

The fellow on the right has a lower. wider stance to give him strongth and stobility. In the some way, U. S. Reyei's now Low Profile Hres are lower, wider then conventional tires. They have the extra ruggedness and stebility needed to keep you sufe and give meximum weer - 91pecially on teday's fest, sen-step superhighways.

Above diagram shows how Low Profile tires are lower and wider than ordinary tires. Engineered closer to actual working shape. So they don't flex as much. Don't strain as hard. Run far cooler than ordinary tures.

They're major against tire failure at high speed, Safer on turns, Safer against skids. They wear longer, Roll concer-save gas. Originally a premium-tire feature-now at no extra price. Ask your U.S. Royal Dealer,

Hole to Probe Mysteries Inside the Earth

Finding out what lies six miles straight down will be one of the world's great adventures

By Aiden P. Armagnac

The ERE going to bore clear through the earth's crust, and find out what's inside. That's the promise of a spectacular U. S. project, sponsored by the National Academy of Sciences, to sink a hole six miles below sea level. Its aim is to reach the earth's mantle, a region of mystery that makes up four-fifths of the world's bulk, and bring up actual samples of the unknown stuff it's made of.

The record-breaking shaft, one of the greatest adventures of the world's explorers, will be bored by a drilling ship in midocean. It can be completed within four

PLAN TO SINK HOLE through earth's crust into mysterious mantle calls for starting at sea bottom more than two miles below surface, as at left, and drilling some 3½ miles farther down. Crust can best be pierced beneath sea because it's thinnest there, as seen in diagram above. Upper layer of granite, present beneath the continents, is missing in sub-ocean crust.

What's Inside the Earth

experts say our planet has a thin outer crust, then a mantle of solid rock, and finally a core, probably of iron and makel, with outer part molten and central part solid. In relative thickness, mantle and core compare to white and volk of a boiled egg, crust is comparatively thinner than eggs shell Recent evidence, notably from observations of earthquake waves, supports this picture and discredits furner idea that there was a world-wide sea of molten lava immediately below the thin crust

ABRUPT CHANGE in nature of rock is shown by speed-up of quake waves some 20 miles below land, less below sea floor. This level, called the "Moho," is considered the dividing line where the earth's crust cody and mantle begins

years, and will richly repay its \$15,000,000 cost in benefits to science and industry. Already under way, with the help of Government funds, is the first practical step—a survey to pick the site.

So reports an NAS committee headed by Gordon G. Lill, chief of the Geophysics Branch of the Office of Naval Research. His group has been studying the bold project, has found it feasible, and has now been directed by the NAS to carry it out.

Origin of name. The planners call their shaft the Mohole, because its goal lies just below the crust-mantle boundary, known to earth scientists as the Moho. Both are named after the Yugoslav discoverer of the boundary, Prof. Andrija Mohorovicic.

The Mohole will begin at the ocean floor, beneath more than two miles of sea water. In turn it will penetrate a layer of sediment and a thicker one of basalt rock. Then, having pierced the crust of the earth, it will poke at least 100 to 200 feet into the rock of the mys-

terious mantle—a prospect more exciting to the explorers than a look at the hindside of the moon.

When an oil-seeking Texas well recently reached a depth of 25,340 feet, nearly five miles, it was the deepest that the subterranean world has ever been penetrated. By going just a mile farther down, at the right place, the Mohole will add far more to our knowledge of the earth's interior.

There's a good reason for starting the Mohole beneath the ocean. Under land, the earth's crust averages 20 miles thick, under the sea, only five miles. And seismic studies, which provide these measurements of thickness, lately have found thin spots that a $3\frac{1}{2}$ -mile boring can pierce.

Choosing the site. Now U. S. research vessels are examining the thin spots as prospective sites for the Mohole. Surveyed so far are an Atlantic area north of Puerto Rico; and a Pacific region, which looks more promising, off the Mexican coast between Guadalupe and Clipperton

The world's greatest unexplored region lies only a few miles beneath our feet

Earth's Skidding Crust Has

WHOLE SKIN of earth has periodically slid about, it's believed, over plastic layer in mantie. Studies of rocks' magnetism indicate that poles have shifted far, with South Pole once in equatorial

Africa. By one ingensous theory, motive force came from lopsided polar icecap, which the earth's spinning pulled toward the equator until the warmer latitude melted the ice.

Islands. The final choice may be made by early next year.

Drillers will begin actual operations by sinking several practice holes, in shallower water and to lesser depth than the Mohole. For this they'll adapt available offshore-drilling equipment. Then will come the construction of a built-toorder drilling ship, and the reach to the mantle.

The scene of the great adventure will be the largest drilling ship ever built, topped by a towering derrick rig. It may dispense with anchors, maneuvering constantly with large outboard-type motors to remain centered within a 1,000-foot-diameter ring of marker buoys at the chosen site. Currently this looks to the planners like the best way to hold the vessel, despite wind and current, within a permissible 240-foot radius above the hole being drilled.

Ideas from offshore oil. By remote control the drilling crew will set up an advance base of operations on the ocean floor. Lowered into a shallow borehole

there, a six-sided "landing platform" will be securely cemented in place. Then a drill string extending down from the surface, and passing through casing at the platform's center for guidance, will proceed with the boring.

In this system, already used successfully to drill oil wells, the drill string can be remotely uncoupled and recoupled at sea bottom. Vertical guide cables between surface and landing platform make this possible. So the Mohole drilling ship can suspend work to flee or ride out a storm, leaving the lower half of the drill string sticking out of the hole, and the guide cables marked with buoys. On returning, it can quickly make connections again and resume drilling. If a drill string snaps, the system will easily relocate the hole, saving the project.

Turning the miles-long drill string from the surface to bore the Mohole might cause excessive whip and vibration. So power may be applied at the lower end to a turbodrill, which is rotated by the flow of drilling fluid down the pipe; or to a sound drill, whose bit is vibrated at

high frequency by the fluid.

High temperature—expected to reach almost 400 degrees F, at the Mohole's bottom, compared with 350 degrees in the five-mile Texas well—will raise no serious drilling problem. Boreholes have been successfully drilled in abnormal heat up to 460 degrees, the temperature in another Texas shaft, which is called the world's hottest well.

As the Mohole descends, "cores" or cylindrical rock samples will be brought

to the surface. Probably they'll be taken continuously in the sediment layer, at intervals in the basait layer, and continuously again in the mantle. Planners expect to use a method called wire coring: A wire lowers a sampling tool down the drill pipe and hauls it back with the sample, without interrupting the drilling. Earlier practice operations will test and perfect the Mohole's sampling technique.

From its very start, practice holes included, the expedition to the mantle will be making thrilling revelations.

Marine fossils in the sea-bottom sediment may trace back the evolution of life to its very beginning on earth. So far, tools lowered from re-

search ships have been able to sample only the top 100 feet or so. By going all the way through, the Mohole drilling will

bare the whole exciting story.

Somewhere below the sediment the drillers may find the original surface of the earth—completely hidden, today, beneath lava-built continents or ocean water and coze. It may be pitted with meteoritic craters, and resemble the face of the moon.

What will they find? The climax will come when the Mohole breaches the bottom of the crust, and specimens from below start coming up. Then the explorers will gaze upon chunks of a heavy rock, possibly black in color—the first samples of the earth's mantle ever seen.

Will it be some known sort of rock? Or will it be something more exotic, a weird new kind, created by a pressure 2,000 times as great as in our surface world? Whatever comes up from the mantle is sure to get the most searching variety of tests a rock ever had.

Using the Mohole. Tapering perhaps from eight-inch diameter at its mouth to

Using the Mohole. Tapering perhaps from eight-inch diameter at its mouth to four-inch diameter at its bottom, the Mohole will permit lowering instruments all the way down. From the subterranean outpost, electric wires will bring back

direct observations of temperature, magnetism, gravity, and every other clue the Mohole can contribute to new knowledge of the earth's interior.

The Mohole may well yield practical rewards: new information about the origin and extent of petroleum deposits; faster, cheaper, and better techniques for deep oilwell drilling. Powerful undersea pumps and load-handling equipment developed for Mohole use may later aid in mining the sea for valuable minerals.

Such commercially interesting prospects make it unlikely that the Government will have to foot the whole bill for the Mohole project. NAS planners think oil companies, and others, will make

substantial contributions in money and materials. Offers already received include one from General Electric to lend a million dollars' worth of diesel-electric generating equipment.

By now the planners feel reasonably confident that remaining problems of engineering and financing will offer no snags. To their head man, Gordon Lill, the chances that they'll actually start drilling the big one look better than five to one.

New theories. The Mohole will cap recent advances in earth science, which have already turned earlier ideas of the world's construction topsy-turvy.

Pecos County, Tex., recently set drilling record of 25,340 feet, or nearly five miles down.

[Continued on page 250]

2. Hey, what's going on here?

3. This thing takes time.

TINY DRAMA-BIRTH OF A CHICK

A THREE-YEAR-OLD watches the mysteries of life unfold. The sequence was photographed at the International Animal Nursery at Coney Island, Brooklyn, N. Y.

There city-bred children can cuddle and feed a wide variety of animals. They can also watch—at a special exhibit—the emergence of chicks from hatching eggs.

SHOOTING CAR. This police car sports a gun barrel on its hood. The gun is triggered electrically from a pistol grip on the dash. It was shown at a demonstration for Rangers and other law officers in Texas. It fires ,357-magnum bullets,

SPEEDIEST SUB. A U.S. Navy photo shows the engine room of the Appowered Skipjack, fastest sub known. Steam turbines beside the engineman drive the screw. Overhead pipes supply steam from nuclear-heated boiler tubes.

PS PICTURE NEWS

4. Oh, it's a baby chick coming out of the shell.

5. It's pretty, too.

6. And so soft and fuzzy.

THREE LITTLE PIGS. These pigs will go to college instead of to market. Specially bred for small size at the University of Nebraska, they weighed 9½ pounds at birth, 40 after 140 days. They'll be used for research.

BIG BOMB BAY. No plane fuselage is this, but the bomb bay of an eightjet Boeing B-52. It measures 12 by 14 feet, can launch America's Sunday punch —a guided missile to strike hundreds of miles beyond the bomber's range

T-Men's New Tricks Trap Bootleggers

Using cars, planes, radios, and gadgets they won't even talk about, revenouers are winning the war against illegal booze

T'S getting so a man can't hardly make a dishonest gatton or witten, and more. The revenouers are clearly out a dishonest gallon of whisky any front and winning in their ancient contest with the bootleggers. Their edge comes partly from shrewd use of modern tools of science, partly from tighter laws, mainly from old-fashioned police legwork.

The box score of illegal stills knocked out shows how far ahead the Feds are getting: In 1956 (a peak year), more than 14,000 stills were seized; the number dropped to 12,000 in 1957 and close to 9,000 last year. This record means money in the bank to John Q. Taxpayer Every gallon of illegal liquor cheats the U. S. government out of \$10.50 in taxes a loss you have to make up.

The cops with the long, long titles enforcement agents of the Alcohol and Tobacco Tax Division, Internal Revenue Service—and motley nicknames—revenooers, Feds, T-men, agents, branch walkers, bird doggers, bomber boyswork every trick in the book and some that aren't in it. To get the mash and the men who deal in it, they use airplanes,

souped up cars, handie-talkie radios, telescopes, telephoto cameras, fingerprint and handwriting analysis, plus a number of gimmicks they won't tell anybody about

The Case of the Moonshiner's Nails is a good example. It started when agents moved in fast on a still hidden in a Virginia ravine. The moonshiners slipped out through the brush faster yet. The still wasn't even finished; carpenters' tools and nails lay hastily discarded.

Down the road a piece the reserve line of revenopers waved over a fast-running car, "Just ridin' to Aunt Tillie's to do some fixin' up," the driver said. He had a few tools in the back, sure enough-and a keg of nails.

Now the scene shifts to the Washington Laboratory of the Internal Revenue Service. Routine checking of legal alcohol was put aside for examination of some nails under a microscope. The machines that make nails leave marks on their product, marks that are as individual for each machine as the marks on a bullet are for the gun that fires it. The

MOONSHINE: Mountaineer's old-fashioned pot-still is shown at left, in one of series of diagrams of illegal stills that decorate office of chief T-man John Lathem. Such crude plants are common in the South where bootlegging is often a way of life. Steam distills off a fiery but drinkable whisky from fermented mash, made by cooking com or any other grain.

HANDIE TALKIE synchronizes attack to catch moonshiners at work. Timen seldom have to use their guns.

for 750-gallon moonshine still in woods of St. Mary's County, Md.

OPIN BOXES held fermenting mash. Product was bottled in fruit jars (note two floating in box at right).

microscope showed them plainly. There was no question: The nails from the keg in the car were identical to the nails found near the still.

Where there's smoke, there's firescater. Nail identification is unusual, but airplane spotting is standard operating procedure in the mountains of the South (90 percent of the country's illegal stills are concentrated there, with the rest centered around cities such as New York, Philadelphia, and Detroit). A curlicue of smoke over the woods calls for investigation. It could be only a cook fire in a lonely cabin—or it could give away the boiler of a still. A lightplane makes it easy to see the smoke and check for boilers and vats that can be snugged behind hills many miles off a passable road.

The moonshiners are wise to this gambit now, of course. The smart ones camouflage their plants like an Army gun emplacement, covering the setup with nets supporting leafy branches.

Farther west, where the country is open, concealment grows more elaborate. One still was found entirely underground, in the secret basement of a new barn, a buried pipeline supplying its steam from the farmhouse

Long-distance snooping. The revenocers adapt to the terrain, too. Lacking brush to hide in, close-up surveillance is out—snoopers would scare off the quarry. That's where telescopes come in. Posted on a knoll a safe mile away, a man with a

Northern bootleggers make pure alcohol in complex equipment, elaborately hidden

CSLLAR-TO-ATTIC STILL, its parts tucked into every imaginable nook and cranny of house in a New Jersey suburb, was raided before it could be used illegally. Revenue agents (who took these pictures) found copper column (right) inside bedroom closet.

ATTIC revealed water tank and still condenser. Pure-alcohol product of such stills is undrinkable and most be diluted by the purchaser.

cettas, reached via trap door in floor, contained oil-fired boiler. Plant, like most in North, was soundly engineered and expertly built.

good scope can pick up lots of interesting and incriminating information—most particularly, license-plate numbers of regular callers at the hidden still.

Yet the neatest trick with a telescope was pulled right in the close confines of a city. The Feds were hot after a well-heeled gang that covered its tracks all too well. These were no tinhorns operating from the back room of a saloon; headquarters was a respectable office on the eighth floor of a midtown business building. That gave the agents an idea.

They rented an office on the eighth floor of the building directly across the street and set up a telescope at the window. Then they got a lip reader into the act. Seated at the scope, he took down the gang's secret conferences, word for word.

Hot cars are a vital weapon in the T-men's arsenal. Not for the reason you'd guess if you've been watching those old prohibition-era movies on TV—there are no more racing fights with Tommy guns blazing from the tonneau of the mobsters' big black Packard. The cops need those fast cars to catch booze-hauling deliverymen.

Day of specialisation. The bootleg racket, like any big business, is subdivided into more-or-less independent specialties: distillers, wholesalers, distributors, re-

Stacked at an angle, seven cars can be parked in the same space that four ordinarily occupy.

CAR TILTER STRETCHES PARKING LOT

In this parking lot, a motorist drives onto a rack. When he gets out, the attendant lifts the rear end of his car 30 degrees on a hydraulic jack. Then he rolls tilted car and jack sideways on rails to its parking place. The Auto-Pack System was developed by All American Engineering Company, Wilmington, Del.

above may be useful around home as well as on streets. It has a centrifugal system that separates litter and dirt as it sweeps, works on a 1\(^4\)-hp, gas motor. The vacuum is being tried in London.

WHIRLY-PROP. Fairchild will build this three-bladed autogiro for commercial sale by the Umbaugh Aircraft Corp. It has conventional helicopter rotors for vertical lift, plus an airplane power plant and propeller for forward flight.

The Fabulous and Deadly

TARLY in 1962, this weird-looking I lurd, the world's fastest bomber, is due to try its triangular wings Enough details have now come out to make possible this artist's conception

The Valkyrie, as the Air Force calls its 2,000-m.p.h. B-70, will be a lethal blend of plane and missile. Driven by six jet engines, each developing 25,000-lb.

thrust, it will fly intercontinental missions in incredibly few hours without refueling. It will be able to deliver a massive H-bomb load. In addition, it will carry nuclear missiles designed to dart off at other targets 1,000 miles away.

The B-70, being built by North American, will flash so fast through the thin, frigid air 70,000 feet or more above the earth that its skin temperature will rise several hundred degrees. But its four-man crew will be soug in a sealed cabin.

About 170 feet long, the 250-ton bomber will have a span of around 115 feet. Stubby frontal controls and two tall tail fins will help it maneuver. It will protect itself with electronic devices instead of guns.—Wesley S. Griswold.

PS PICTURE NEWS

Roof is in place and inflated. It's held up by 18 pipe columns.

Here is the completed structure; a tent with no center poles.

EVERYBODY'S SEAT IS GOOD IN THIS TENT

The structure at left, for the Boston Fine Arts Theater, started out to be a tent, But tents, with center poles and such, can't furnish an unobstructed view for a large audience.

So the architects built a steel ring, 145 feet across, with 18 pipe columns to support it. They covered this with a disk-shaped vinyl-coated nylon balloon, 26 feet deep at its center when blown up. Then they draped the sides with canvas and added a tented stage.

The air-filled roof does more than just keep off rain: It offers fine insulation against the heat of the summer sun.

RIDING ON AIR.

Two research engineers for Bell Helicopter built this air-cushion car for their sons. It travels on a cushion of air from a ducted fan [PS, July].

It was built on a frame covered with cardboard and cost about \$2. However, the ducted propeller was borrowed from the company laboratories. To buy it would take several

thousand dollars.

BABY JEEP. Here is a utility car you can buy for \$1,350. Looking like a jeep that shrank, it weighs only 1,100 pounds. Overall length is 111 inches, wheelbase 63 inches, tread 40 inches.

Crofton Marine Engine Co., San Diego, makes it, calls it a Bug. It runs on a 35-hp, four-cylinder Crofton engine. Dual rear wheels give it good traction even on sand.

Hottest New Compact Car

Bigger in body and engine than other compacts, Valiant offers high performance, good mileage

By Ken Fermoyle

ROM a secret redoubt in farthest Detroit, a Chrysler task force last month launched a dashing new battler into the five-way compact-car free-for-all.

Chrysler's Valiant is "small," but it's a cat of a different breed. It's bigger than GM's Corvair, Ford's Falcon and Studebaker's Lark, but it's smaller than the Rambler. It outweighs the Corvair and Falcon, about matches the Lark Six, and is 300 pounds lighter than the Rambler Six.

It packs more power than the Corvair

or Falcon or Lack Six but less than the Rambler Six.

The Valunt has zip. The styling is flashy, with a European tang. It breezes away from a stop light to 60 miles an hour in 15 seconds, thanks to the husky engine in OHV six that gets 100 hp. out of 1714 cut in 3.2.5 in bore, 31 sin, stroke).

Gas economy? The penalty for weight

Corvair's or Falcon's—but more than the Rambler and Lark sixes. Official claims mention 25 miles per gallon of regular gas.

Engineering innovations include an engine that is tilted and a generator that makes AC instead of DC

Handling can't be faulted. The Valiant rides its own version of the Chrysler

suspension; torsion bars up front and wide-based leaf springs at the rear. The car stays flat and upright, without body roll or sway, even when cornered fast and furiously.

Steering is light and quick. It takes just 3½ turns of the steering wheel to turn the front wheels from full right to full left. You can get power steering, but you don't need it.

Familiar Chrysler pushbuttons control the optional three-speed automatic transmission. It is modeled after the Torque-flite gearbox used in the corporation's big cars, but is lighter by more than 100 pounds.

The Valiant is billed as a six-passenger car—and it comes about as close as most standard-size automobiles. With a full load aboard, however, the middle pas-

FLOOR-MOUNTED SHIFT LEVER on manual-transmission models complicates life for the middle passenger when three are in front, but makes for easy shifts. Lever throw between gears is short and positive. Automatic transmission modeled after Torquefite is optional.

sengers had better be small or the ride short.

The big look outside (184 inches long, 70 inches wide, 54 inches high) gains the passengers extra leg room inside, but not much else. Front leg room (44.4 inches) beats both Corvair and Falcon. Rear leg room (38.9 inches) exceeds Corvair's by more than three inches, but falls short of Falcon's.

Hip room is 57 inches front, 56.9 rear. This compares with 578 front and 57.6 rear for the Corvair, 57.1 front and 57 rear in the Falcon.

The seats are comfortably high: 11.4 inches front and 13.4 inches rear. They

slope deeply—you sink right into them -to provide more usable head room than the figures (33.6 inches front and 33.4 rear) suggest.

The 25 cubic feet of luggage space is more than double Corvair's, but just a fraction more than Falcon's.

It's easy to get in and out of the car. The doors open 88 degrees, and the sillto-roof gap is even bigger than in standard-size cars.

Inside, the Valiant is simple but not cheap. The plain dash has a circular speedometer recessed in a nacelle to the left, gauges in a matching nacelle to the right. If you go for the fancier V-200 series, you get 21/2-inch foam cushioning on the front seats, flashy vinyl and nylon upholstery, and carpet on the floor.

Under the hood. Up front you see more striking differences from Corvair and Falcon. Valuant went to the leaning engine because it lowered the bood line (the stylists liked that), gave a low center of gravity, and left room for an improved intake manifold (the engineers liked that).

Tilted engines began showing up in Indianapolis race cars—they call 'em "sidewinders" there—some years ago. At first they had oiling problems. Valiant engineers claim they've had no such difficulty.

Intake and exhaust systems also smack of racing practice. The right-tilting engine leaves room for a long-branch manifold on the left. Six long, gently curving tubes of nearly equal length route uni-

PULL OUT THE GRILLE EMBLEM—and you unlatch the hand. It is low, for the Furopean look, ending in grille reminiscent of Chrysler 300E.

YOU PUT THE GAS IN at the left rear fender. It'll take 13 gallons, which the company claims is enough to propel the Valiant 325 miles.

by 300 pounds—but zips from zero to 60 in 15 seconds

form amounts of fuel to each cylinder eliminating the uneven fuel distribution common in sixes. Casting the manifold from aluminum cuts weight, keeps the fuel charge cooler and denser than castiron manifolds.

A six-port exhaust system works with the intake manifold to eliminate engine asthma. None of the exhaust ports is "Siamesed" to serve several cylinders, as they are in most sixes.

The cast-iron engine block is light for its displacement. Modern casting techniques keep wall thickness to a minimum. Extensive use of aluminum also helps.

In addition to the intake manifold, the generator and distributor housings, pistons, water-pump housing, oil-pump housing, oil-filter pad and water-outlet elbow are all aluminum castings. The clutch housing, transmission extension and entire automatic-transmission case, including the torque-converter housings, are also aluminum die castings.

AC into DC. Another engineering surprise is the AC generator. (The car doesn't use AC; six silicon diodes rectify the alternating current into standard 12volt direct current.)

One reason for the change is accessories. DC generators produce no current when the engine is idling. AC generators do (this one can crank out 10 amps at idle, builds up to 35 amps at higher speeds).

So the alternator means you can play your radio and run the heater while poking through traffic without worrying much about dragging down the battery.

As a fringe benefit, the alternator is light. It saves 9½ lb. over a DC generator—partly because a lot of aluminum is used to build it, partly because the field (the heavy cylindrical outer part of a DC generator) is the rotating member and therefore is smaller. It needs no cutout; the diodes prevent reverse current flow.

Vibration control. Valiant engineers burned lots of midnight oil designing the engine-mounting system. When they were finished, they had not only done much to isolate engine and drive-train vibrations from the car body, but they'd also put the engine to work as a dynamic vibration damper.

The front mountings are shear-type

IT'S EASY TO GET INTO, thanks to generous door opening and straight doorpost, without knee-catching dog-leg. Interior fittings are simple and attractive Buttons to left of instrument cluster control automatic transmission, ones to right control heating-ventilating system.

The rear mounting, which supports the rear of the transmission, consists of a single block of rubber bonded to steel plates attached to a bolted-in cross member.

The engine mountings are "tuned" to the rest of the car structure. This was accomplished by determining the rate at which the structure vibrates most severely when jiggled—"excited" is the term engineers use—by the suspension. Then the engine mounts were designed so that the entire engine vibrates exactly out of phase with the structure. When the car structure bounces up, the engine pushes it down; and vice versa.

More than 5,300 spot welds and seam welds join the hundreds of steel stampings in the Valiant's unitized body. Box-section reinforcements distribute driving, braking and suspension loads.

Valiants come in two series: V-100 and V-200. They're identical in dimensions and machinery. The V-200 models simply have deluxe trum and appointments. Each series includes a four-door sedan and two four-door station wagons.

Original Compact Cars Slicked Up for '60

Lark's grille, with emblazoned emblem, has new chrome finish. Instrument panel is restyled.

A CONVERTIBLE, first by Studebaker since 1952, is one of the additions to the Lark line.

CONVERTIBLE'S FRAME is box-section ladder type with heavy, stiffening member in center.

V-8 ENGINE, with dual exhausts and four-barrel pot, produces 195 hp., up 15 from '59.

LUGGAGE COMPARTMENT, containing 16.5 cubic feet, is generous for meager rear overhang.

104 POPULAR SCIENCE NOVEMBER 1959

THE U.S. cars that started all the ruckus over size and fuel economy appeared in showrooms last month in their 1960 attire. For automobiles that pride themselves on being as unchanging as the tides, the Rambler, Rambler American and Lark exhibited surprising alterations.

All three come in new models. All have undergone alterations in looks. All

have expanded their packets of optional accessories. The modest little American presented a shocker—power steering at, of course, extra cost. The modest little Lark upped its horsepower.

A new convertible, a new station wagon and a new four-door sedan comprised the centerpieces of the American Motors and Studebaker-Packard Corp. displays.

New fins, decorative spears and creases on the roof and deck lid identify new Rambler.

INSTRUMENT PANEL is new. Windshield and rear-window pillars are slimmer and slant more.

FOUR INCHES SHORTER, like all '60 Ramblers, new three-seat wagon has a side-hinged door.

American

rour-book sedan is newest addition to Rambler American's stable of cars. Among the options: air conditioning. Among the changes: easier-access doors, more glass, larger fuel tanks, and brake linings that are bonded instead of riveted to the drums.

Priced just above the "compacts," these cars give you a wide choice among—

Detroit's New Five-of-a-Kind

If you hanker for a Dodge at a lower price, with a bit less floss, this is it.

Completely restyled, it has a ridge of projecting sheet metal at the waist line.

By Devon Francis

N THE first of this month U. S motorists were richer in choices of domestic cars than they had been in a quarter of a century. With all Detroit's 1960 tinseled hardware on showroom display, the tally was impressive. There were 26 different names to choose

from. Not since 1934 had there been so many homegrown brands on the market.

There was another fact of even more importance. Motorists had a bigger choice in the lower-priced group of vehicles—where seven out of every 10 cars are sold—than they had had in many a year. With dealer discounts, there were

With minimum changes in the basic car, Chevy now offers new operating economies.

All dimensions have changed—it's a lot longer and wider, and a full inch lower.

For 1960, doors are bigger, and better contours reduce wind resistance.

11 brands that could be bargained-down to \$2,000 or less.

Motorists had not seen a brand spectrum that wide—bearing in mind the relative prices of cars, not the specific dollarprice, swollen by inflation—since the mid-1920s.

The main reason for all this, of course, was the introduction of Detroit's new,

small, low-priced cars, the Corvair, Falcon and Valiant. There was a fourth newcomer, the Dodge Dart, at a somewhat higher price.

These freshly minted names were bracketed with seven cars already prominent on America's automobile rows— Chevrolet, Edsel, Ford, Lark, Plymouth, Rambler and Rambler American. Most of these were available at substantial cuts under the "factory-suggested advertised delivered price."

The Chevy, Dart, Edsel, Ford and Plymouth are, as a poker player would say, five of a kind. All are lower-middleprice cars that can be horse-traded down to a price of \$2,000 or less if the customer doesn't insist on a V-8 engine and such geegaws as an automatic transmission

Chevrolet

THE Chevy people have been content with refinements of their 1959 design. Prow and stern are restyled. The transmission tunnel is an inch and a fraction lower in the front compartment and an inch and a half narrower. The car is quieter—rubber body mounts are huskier

One useful gimmick is a simple yourbrakes-are-on warning: When you set the hand brake, the release handle pops out.

Following the current trend, Chevy has reduced axle ratios. This will make for

Dart

DODGE'S new Dart is to the Plymouth what the Edsel is to the Ford: Each pair of cars shares some sheet metal and a lot of mechanical innards. The only reason for creation of the Dart was to give Dodge dealers another car to sell—the Plymouth does not appear in Dodge showrooms in 1960.

The Dart is a smaller Dodge or a slightly fancier Plymouth. It shares Dodge's styling fore and aft, and such items as a speedometer mounted atop the

Edsel

IN THIS, its third year, the Edsel is wider and longer, to distinguish it from the Ford. But it shares with Ford a complete lack of front fenders—if, indeed, fenders could be called fenders at all in the last dozen years. Sheet-metal plates, simulating fenders, now bolt at

the sides of a hood so wide that it staggers the eye. This is going to delight mechanics leaning over the sides to ply their surgery on engines.

The body metal is all new. Most of the windshield-post dog-leg, introduced when all Detroit was in hysterics over wrap-around glass, has been eliminated. This gives front-seaters an entrance area almost 10 inches wider.

Like the Ford, the Edsel has a long list of new mechanical features. One of them is a radiator that makes the water flow crosswise instead of up and down. That's necessary because, as hoods have become lower and radiators squattier, the engine fan has covered less of the radiator area. Laying the radiator on its side, in effect, is one solution to the problem of better cooling.

and power steering. All offer fairly muscular six-cylinder engines. All weigh 3,500 pounds and up. All are cars of big dimensions in the sense that Dodges, De Sotos, Mercuries, Buicks, Pontiacs and

Oldsmobiles are not much bigger, and that the new small cars are a lot smaller.

Let us here, then, have an alphabetical look at these five cars as they affect your new-found smorgasbord choice of a buy.

better gas mileage. The camshaft on the 283-inch standard V-8 is redesigned for the same reason. The paper carburetor air filter, hailed as a new technological breakthrough by several manufacturers two years ago, is now discarded by Chevy in favor of a permanent, oil-wetted element. And you'll have to remember about the new gauges. The needles don't go to zero when the ignition is switched off. They float freely and may indicate almost anything.

MOST STRIKING STYLING CHANGE is disappearance of cat's-eye tail lights, new dog-leg has.

instrument panel, for easier viewing, and a straightened middle body post on fourdoor hardtops for more entrance room.

It shares with Plymouth the bigger of the two canted six-cylinder engines described in October Popular Science.

It also shares the Chrysler family's fresh engineering developments—light-weight automatic transmission, redesigned rear shock absorbers, quieter door latches, softer engine mountings and easier steering. It has a modified unit body.

SPEEDOMETER "FLOATS" above instrument panel, and the driver's seat has an extra-high back.

With Ford, the Edsel has an improved automatic choke and a muffler attached far back on the exhaust pipe to keep heat from the passenger-compartment floor in hot weather. A six-cylinder engine is prominent among the options.

Edsel's secret pride, however, has nothing to do with the design of the car. That's a program for bettering its assembly quality, a migraine headache to all auto manufacturers. At Louisville, Ky., where Edsels are put together, there is a man named Al Clark who is professionally bad-tempered. A dozen men under his direction go over each Edsel as it comes off the production line to find fault with it. If something is wrong, back it goes for a fix. Al Clark's bad temper should improve the temper of many an Edsel customer.

FOUR EXCLAMATION POINTS replace gull-wing tail lights. Luggage compartment is bigger.

PANEL'S IGNITION SWITCH has inside terminals to foil thieves who bridge points.

Ford

THE latest figures from the Bureau of Public Roads show that the average U.S. passenger car, traveling 9,391 miles a year, gets 14.5 miles to a gallon of gas. At 30 cents a gallon, that tots up to some

\$50 more a year than if it got 20 miles to the gallon.

Ford's Ford Division, caught up in the gas-economy fever sweeping Detroit, has revised its standard 292-inch V-8 for more miles-per-gallon.

Intake-valve diameters, expanded year upon year, are now reduced. Intake pipes, enlarged year upon year for "better breathing," are now smaller. The result, at low r.p.m., is that the air-gas mixture courses swiftly from carburetor to valves. It stays vaporized. Less gas is used. Low-speed performance is better.

It's an axiom, of course, that an engine that's economical at low speed begins getting asthma at high speed. Ford not only points with pride to the new econ-

Plymouth

THE differences between the Plymouth and the Dart are more apparent than real. They have the same wheelbase, though the Plymouth is eight-tenths of an

inch longer overall. They share a new lightweight automatic transmission and that new six-cylinder engine. They are in the same price class.

Most of the contrast between the two cars is in looks. The Plymouth is in sparkling new dress. Its tail fins are higher, narrower, more streamlined.

"And," adds a company publicist, sniffing at competitive automobiles, "they're still vertical."

The car is a little longer, a little wider, and a whopping two inches lower. Rear leg room is improved, but front headroom is down almost an inch. Seat heights —bravo!—are up. Doors are wider brakes bigger, the noise level lower.

CLEARANGE			МІВТН	невнт	OVERHANG		HEAD ROOM		SHOULDER		MIP ROOM		LEG ROOM

5	118	209.4	78.6	54.6	33.2	58.2	34.8	34.2	60.4	59.8	63	62.4	45.5	42.6

omy of it's V-8, but underscores its sixcylinder option.

Like the Edsel, the Ford is a new car for 1960. Like the Edsel, it has a wider tread and rear springs that are relocated on the axle to damp out "windup" on hard takeoffs and sudden braking. Brakes are bigger, seats are engineered to the "slouch posture" assumed by driver and passengers, and trim fabrics are fancier than ever.

Ford, with Chevy and Plymouth, further buries the myth of being a "low-priced" car. Look at its dimensions for 1960: 5½ inches longer and 4½ wider. That costs money. The car is also an inch lower. For the incurable showoff, horsepowers go clear up to 300.

WITH REDUCED INTAKE-VALVE SIZES and improved choke, 292-inch V-8 is standard engine.

It's on gas economy that Plymouth's attitude toward the customer becomes one with those of the new-day Chevy, Dart, Edsel and Ford. Its new overhead-valve six will go farther on a gallon than the hoary, outmoded flathead six.

Much work has been done on body shape to reduce wind resistance. The publicity pamphlets—the "brag books"—state: "Advance testing indicates that buyers may expect to travel eight to 10 miles farther on a tank of gas."

Axle ratios, naturally, are tailored to reduce engine revolutions per mile. For the six-cylinder engine, the ratio is down from 3.73:1 to 3.54 However, the V-8's ratio remains at 3.54.

STRAIGHTENED WINDSHIELD POSTS make entrance casier, and unit body gives more foot room.

Big and or Sporty

HE big cars are still with us. In its spasm of devotion to little cars, Detroit hasn't forgotten that more than a sprinkling of U. S. motorists like 'em long, low, wide and snorting with horsepower. Some like 'em sporty, too.

On these pages are the 1960 editions of the bigger cars, the hot cars and the cars for the beret-and-sport-shirt set. The biggest and splashiest of them fairly reek of luxury, but none is without its share of platinum.

There's an instrument panel that, in effect, is adjustable, a carburetor that compensates for summer's heat, and an automatic-release parking brake.

Even here, though, the manufacturers are hedging their bets. Most of them offer something that they haven't plugged in years—more miles per gallon.

OUTSTANDING styling feature has been those splitlevel tail fins. The car retains them for 1960. They've been reshaped, though, and look prettier. There also is a new horizontal grille. Doors are wider and higher. There are inches more of hip room for rear-seat passengers and more leg room front and rear. An extra-high seat back gives the driver more comfort. The series names are changed from Coronet, Royal, and Custom Royal to Matador and Polara—one less than last year.

STYLISTS have kept the Buick's essential shape but given it a "heavier" look. Those make-believe portholes are back. Wheel covers are vented for better dissipation of brake heat. Primary panel instruments are laid flat and reflected in a mirror (left) that adjusts to accommodate tall and short drivers. To fight rust, dual exhausts have a common muffler. This eliminates the "cold side" of the system that collected water during the warmup period and eventually ruined the pipe.

THAT extensive array of tail lights—the flashiest in the industry—is gone. The new ones are just as functional but simpler. No longer are there a 126 inch wheelbase and four series. The wheelbase for the only two series offered, the Fireflite and the Adventurer, is 122 inches. All models have compound-curve windshields. and rear doors open wider for easier entrance.

TO Z F

LOOKING less like a missile launcher and more like an automotive queen, the new Caddy is simpler of line. There's a new panel. Funned rear brakes fight fade. A vacuum-operated emergency brake automatically releases, when the engine is running, as the car is put in gear. A slip clutch reduces fan speed and cuts down on its noise on the snooty air-conditioned jobs.

THE grille is adapted from the "300" series. Tail lights are boomerang-shaped. Windows are bigger. Door latches have two distinctive features—they close silently, and when locked the handles free-wheel. The entire panel is electronically lighted—a transistor oscillator converts battery juice from DC to AC, and this is used to excite phosphors in a special ceramic material.

14 POPULAR SCIENCE NOVEMBER 1959

Thunderbird

Partisans who growled about any changes were premature. The grille has been dressed up a bit, that's all. The handsome stern remains unchanged. Buyers who like a European-style sliding roof can have it at slight extra cost. The convertible deck no longer requires manual locking and unlocking. Just turn a convenient switch and the work is done for you by little motors.

Hawk

Transmission, clutch, radiator and power are heftier. The V-8 engine is boosted in cubage from 259 to 289 inches and horsepower from 180 to 210. An optional four-barrel carburetor delivers 225 hp. Brake drums are finned. Headrests are optional with split-back seats. For the very well-equipped traveler, the luggage compartment is bigger than last year's.

Corvette

Sports-car enthusiasts will find some fancy changes in the new Corvette. The optional fuel-injection engine has an aluminum head. The clutch housing is aluminum. So is a new cross-flow radiator. The fuel-injection job, with a competition cam, is up in compression from 10.5:1 to 10.75, the horsepower from 290 to 300. Intake valves are bigger. A rear stabilizer bar gives the car a surprising amount of steadiness in cornering without need for heavy springs and shocks.

WORLD'S LONGEST SUSPENSION BRIDGE

Hanging high over the Narrows of New York harbor between Upper and Lower Bay, this bridge will link Staten Island to Brooklyn (see map) when completed in 1965. It will be 6,690 feet long, its 4,260foot center suspension span exceeding that of the Golden Gate Bridge by 60 feet. Estimated cost: \$320,000,000.

TAIL GRABBER. The rope frame above catches porpoises for the Miami Seaquarium—by the tail. It hits the fish's back, slides to the tail where it is triggered shut. The frame falls away, and the fish is pulled in by the rope.

RAIL BIKE. Trackwalkers in Northern Rhodesia no longer complain of sore feet. This one rides on his inspection job. The bicycle is equipped with an outrigger to hold it steady and three flanged rollers that keep the tires on one rail.

Why We Change When the

OST of us are aware that somehow or other the weather has a powerful effect on our moods and behavior, on how we feel and how well we work. Now, medical climatologists are pinpointing how and why different kinds of weather make us react in certain ways.

Data on 40,000 major crimes were correlated with temperature and other weather factors on the specific hour and day of each crime. The conclusions:

Murder, rape and aggravated assault increased by 45 percent on muggy, warm days and nights, when skies were clear and the temperature averaged about 80 degrees. Such crimes of violence also mounted, by about a third, on dreary days when the sky was overcast and the air very humid, though the temperature was only about 70 degrees.

On the other hand, when the weather was seasonably comfortable, the air dry and crisp (and shortly after a period of bad weather) the crime rate went way down to 75 percent below average.

Thus, humidity in the air (short of rain, which clears the streets) emerges as an "accessory" to murder and rape.

"The incidence of crime is not a randomized affair," observes Dr. Frank C. J. McGurk of Villanova University, who directed this project. "There are peaks and valleys in the crime rate that are not accounted for by the day of the week or hour of the day. It looks as though they're caused by an external factor such as the physical environment."

Sudden changes often trigger heart attacks

Studying 250 cases of coronary occlusion, Philadelphia climatologists learned

that three out of five attacks happened when a cold front appeared abruptly, as both temperature and barometer dropped sharply.

Similar findings were arrived at by Drs. H. C. Teng and Howard E. Heyer, of Dallas, who reported that most of the heart patients who had an attack during a rapid onset of cold (or warm) weather, were either asleep or resting at the time. Physical exertion, therefore, was not involved. It was the strain of adapting to the change of weather that evidently caused the heart attacks.

If you think you do your best work on clear, glorious days, you're mistaken. According to Dr. Igho H. Kornblueh of the University of Pennsylvania Graduate Hospital, prolonged blue skies reduce your productivity. After several nice days, a cloudy or rainy day will boost your output.

And contrary to popular notions, you do not work better—physically—during cold weather than on warm days. Of course, you move along livelier in winter to keep warm but actually your body efficiency drops as your energy and combustion levels rise. On mental tasks, however, you achieve more when temperatures drop and air pressure increases.

In other areas of human behavior,

Weather Changes

Since March, 1958, members of the American Institute of Medical Climatology, headed by Dr. George M. Piersol, have been working closely with the Philadelphia police department, its medical examiner and other officials on far-reaching research projects. Here's what they've learned so far.

Besides the Institute's climatologists, scientists elsewhere are steadily adding to our store of knowledge as well as educated conjecture. Says Dr. Rene J. Dubos of the Rockefeller Institute of Medical Research: "More and more examples are being reported of the complex and varied effects of climate on all forms of life, from the virus to man."

Here are additional findings:

Shifts in weather affect all your bodily functions

The immediate effect of any change in the weather shows up in your blood pressure, pulse, body temperature, urine—actually in all the metabolic and chemical processes of the body. Some people adjust satisfactorily, others cannot.

Often, the weather is the straw that breaks the camel's back: People on the verge of being ill surrender to the illness when a sharp weather shift depletes their strength. To many already ill, a violent break in the weather may push them over the brink to death.

By itself, weather rarely brings on a disease. But pronounced drops or rises in temperature, humidity and barometric pressure alter the body functions just enough to throw them off balance.

Consider ulcers, for example. Last year, Dr. Francis K. Davis Jr., a leading member of the Institute of Medical Climatology, completed a study of patients with duodenal ulcer admitted to the Philadelphia General Hospital. He found that the peaks of hemorrhages from ulcers occurred in March-April and October-November at times when there were marked variations in temperature.

As a result, Dr. Davis suggests that for those prone to ulcers, the best place to live is a warm climate with little daily and seasonal shift in temperature.

Many attacks of asthma occur during thunderstorms, when erratic temperatures, winds, barometric pressure and humidity work a strain on our bodies. In stormy regions, points out Dr. Clarence A. Mills of the University of Cincinnati, there is also a wave of "epidemics" of acute appendicitis. "In these areas," he says, "appendicitis becomes a rapidly fulminating disease with quick progress to perforation and spreading peritonitis."

Why surgeons watch the weather

Some obstetricians believe that a complication of childbirth, eclampsia, is often influenced by a sudden weather shift. The conviction that weather is a factor in surgery is particularly pronounced in Germany. In Hamburg, surgeons and meteorologists compared results of thousands of operations—especially cases of postoperative bleeding and embolism—with the prevailing weather at the time. Now, early every morning, a bulletin is

issued by the Hamburg Central Bureau of Meteorology. Through these bulletins, surgeons are alerted when it will be unwise to do elective surgery (other than emergency operations) that day.

The weather can make you nervous

Mental stability is also affected by swift weather changes. If you've ever felt jittery before a storm, it's understandable. According to Dr. William F. Peterson of Chicago, a pioneer in climatology, "more potentially psychotic individuals become psychotic during weather conditions resulting in oxygen hunger." That's because the central nervous system is unusually susceptible to changes in oxygen supply and the weather has a lot to do with it.

Psychiatrists at mental institutions have often noticed how patients' behavior parallels certain weather changes. In one case, a 22-year-old patient had six violent episodes in a few months—all of them when the temperature was unusually low. A middle-aged woman became homicidal on three nights in one month—each night one of the coldest of the year.

Liquor hits you harder on hot days

Remember that liquor is more potent in hot weather. A small amount of alcohol is usually burned up instantly in your body. But on a hot July day, the alcohol is so rapidly absorbed by your nervous tissues that it doesn't have the normal chance to be burned up. Two cocktails that ordinarily give you no trouble may make you tipsy on a very hot day.

Blame your moods on the barometer

You've probably experienced a morning when you've wakened in a foul mood, cut yourself while shaving, ripped a button off your shirt and growled at your family. If you checked the weather report

that morning, chances are there was a drop in the barometer. That means a lower pressure exerted by weight of the atmosphere on the earth's surface—and on you. Usually it's before a storm, when the winds are starting to blow up and the temperature is shifting.

More people are restless and irritable, have migraine headaches and insomnia, faint and feel depressed on days when there's a decided drop in the barometer. A psychology professor at the University of Illinois found that on these low-pressure days children are most apt to get troublesome and convicts break more rules than usual.

So, when you leave home in the morning and notice there's been a deep fall in the barometer, be prepared for an "off day." Don't overexert yourself, drive with unusual caution, and don't let a foul mood control important decisions.

What Have lons Got to Do with It?

Some scientists here and abroad maintain they've discovered why changing weather can influence your health and behavior. The mysterious ingredient: electrical charges in the air called ions.

These scientists are convinced that

Positive ions can make your mind
and body function considerably below par.

 Negative ions will undo the damage, even make you feel better than before.

How do ions get into the weather-andhealth picture? There are always ions in the air and normally they don't bother us, although over half of them are positive. But, say ion theorists, when this nearbalance is upset by inclement weather, sensitive persons are affected. When the barometric pressure drops, air rushes in to fill the partial vacuum created. This air, descending from jetstream regions or sucked upward from pores in the sandy earth, is likely to import large quantities of positive ions which create your discomfort. Negative ions, produced by cosmic radiation and ultraviolet-treated layers higher up in the atmosphere, give you that invigorated feeling after a thunderstorm.

Use of negative ions in various devices for treating many ailments is common in Soviet Russia, but only three U. S. hospitals are using them. They are being tried, experimentally, particularly for airborne allergies such as hay fever. Some air-conditioner makers are getting into the act, too, Doctors, generally skeptical, are cautious about interpreting results.

in the world," puts him in immediate communication with every far-flung SAC stronghold. At his command U. S. B-52 and B-47 bombers could be roaring down 70 runways scattered around the world in a matter of minutes.

A visit to the buried vault that protects the brains and buttons behind our global air force

By Frank Harvey

THE U.S. nerve center for intercontinental bombardment—SAC's global command post at Offutt Air Force Base, near Omaha, Neb.-had the gay air of a resort hotel as the staff car swept around the curve that sunny afternoon. In the foreground was a large pool in which hundreds of SAC men. women and children splashed happily.

"Doesn't look very warlike," I said to the airman driver.

He pointed to a sign: a mailed fist clutching an olive branch and several jagged lightning bolts, plus the words: Peace Is Our Profession!

"Don't let that alogan fool you," the airman said, "We don't want to fightbut if we have to-brother, we sure can do it. There'll be a big Atlas ICBM site around here real soon. If anybody attacks us, all we do is press a button-wait half an hour—and blooocey!"

"But the other guys," I said. "Can't

they press a button, too?"

"That's why we've got our command post buried underground," the driver said.

Nerve center of SAC: where brains—human and electronic—

"I hear she'll take a direct hit with an H-bomb and still be in business."

Later, making a tour of the underground installation, I felt that the airman was being a little optimistic (the H-bomb at Eniwetok dug a crater 17 stories deep). But it would sure take a bull's-eye to do the job. And a direct hit by an ICBM fired 6,000 or more miles away may be on the order of impossible.

"HOW about sabotage?" I asked Captain Ed Derryberry, my guide for the tour. "Suppose somebody sneaked in here with a bomb and blew up the joint?"

Ed grinned, "Right now," he said, "you're on television. You're being watched by guys whose job is to see that nobody gets in here with a firecracker—much less a bomb!"

I looked up, and, sure enough, a camera was peering at me from behind two floodlights. "For the sake of argument," Derryberry went on, "suppose some saboteur actually succeeded in wrecking this command post at the zero minute—just when reports of a big raid started coming in. It would hurt—but it wouldn't be a body blow. We'd simply switch to another command post set up to do the same job

SINGLE-SIDEBAND RADIO in this small room took me on a voice trip to SAC bases around the world—with stops at Guam, Saudi Arabia, Spain and the Azores—in 20 seconds.

—and if that one went out—we'd switch to a third. SAC never was in favor of carrying important eggs in one basket."

"I guess everybody who works here is

cleared for Top Secret."

Derryberry laughed. "Listen," he said. "We've got jobs down here so touchy we don't allow a mere Top Secret clearance in the same part of the building!"

He demonstrated the cloak-and-dagger nature of the place by pausing in front of Weather Headquarters, which at most bases is about as secret as an old comic book. The steel door was locked. Derryberry knocked and a panel opened and an eye peered out through a peephole. "Business?" a voice asked curtly.

Derryberry told him, There was a delay, then the clicking of a lock, and we were permitted to take a fast supervised look at weather maps that showed (as of right then) how much cloud cover they had at Fairbanks, the winds aloft over Greenland, and several thousand other details of vital importance to an SAC bomber headed out.

Much of the underground pillbox at Omaha is devoted to machines. In a single-sideband radio shack, two sharp sergeants gave me a quickie demonstration. They got a reply from Guam in six seconds. They tried Eielson Air Force Base in Alaska, couldn't raise it in five seconds—so "patched through" March Field.

Cal., and got Eielson in 10 seconds.

THEY tell a story about the general who tried to call his office from the single-sideband radio in his car while on the way to a golf game. Local disturbances prevented the call from going through. So he called Torrejon, Spain, and they patched him back to Omaha. Ten seconds later he was talking to his office, "Left my clubs behind the filing cabinet," said the general. "Send them out to the course, will you?"

The command post is never shown to visitors when in "combat configuration" —with war-plan panels rolled out into view. When Derryberry and I walked through, the floor-to-ceiling drapes concealed everything except routine weather data and nonclassified plane movements.

He showed me the famous red tele-

never sleep

WEATHER ON TAP for H-bombers, Reports are gathered around the clock from stations all over the world. Fed into the Omaha grotto by radio and teletype, they are plotted on mapsevaluated into forecasts -pumped out twice daily to all SAC bombers in the air. If the whistle blew, no lastminute weather bricking would be necessary. The commander of each plane already would know the current forecast over the route to his designated target.

phone that connects instantly with every U. S. bomber base all over the world. The red phone had another red-phone backup, plus 60 separate "hot lines," plus SOCS (Strategic Operational Command System, a private world-wide telephone net), plus single-sideband radio, plus conventional communication radio. It seems impossible that there could ever be a serious breakdown in global communications between Gen. Thomas S. Power, SAC commander, and his bombers.

One of the biggest and most ominous machines is a special IBM 704 computer. It fills a whole room with its electronics, and can boil down a massive jumble of information into crisp, orderly answers in slices of a second.

SAC's controllers are far from helpless against an attack. By flipping a single switch they can in seconds seal off the underground stronghold with 1,500pound steel doors. Something called "The Snifter" would tell them how close Hbombs are falling and the intensity of radiation from fall-out. A board full of red and green lights tells which doors are open, throughout the complex. A tricky little alarm system goes off when curious fingers get to fumbling with doorknobs they shouldn't. The War Room is, of course, supplied with filtered air; and there are heat, light, water, power, food to conduct a 30-day war underground without once unlocking those massive doors. There are clocks that tell the time in Tokyo, Guam, Alaska, Omaha, Thule, London, and Moscow.

"ONE thing worries me," I said to Captain Derryberry. "Suppose you scrambled your H-bombers on a red alert. And then suppose the alert turned out to be a phony—and you couldn't get through to the boys by radio, and they went on their way?"

"Couldn't happen," Derryberry said.
"Our bombers automatically turn back—well outside enemy defenses—unless we specifically call them and order them to continue."

"Suppose General Power is off in Washington?"

"General Griswold, his deputy commander, would run the show—and if he were gone, we have half a dozen other top-flight officers checked out in the War Room."

"How does an officer 'check out'?"

"Just the way you do in a plane—by running the thing over and over for months and years until you can do it automatically—even under pressure."

Above ground again, my tour over, the women and kids were still splashing in the turquouse pool. I thought of the hundreds of highly disciplined men, and the millions of dollars' worth of glistening machinery, that were on guard below to keep them—and us—safe.

New Ideas from the Inventors

Auger Prop Cuts Ice or Water. With two auger-type rotors to propel it, this recently patented boat would cut through weedfilled water, or skim over ice and snow

covering a lake. Inverted troughs on opposite sides of the keel partly enclose the rotors, stabilize the boat in water, and double as sled runners.

Cup Holder is Two-Faced. A clown face on this tip-proof cup holder would register an approving smile when a child lifted his milk mug, then change expression when he put it back. The tongue, on pivots, would stick out when the cup was neated, retract when it was lifted. Punch Opens and Vents Can. In one operation, this two-pronged opener would punch both spout and vent in any standard beverage can. A hooked tip, shaped to engage the bead of a can, would form a fulcrum for the two beveled cutters bridged across the lever arm.

New Oil Burners: Smaller, Hotter,

The completely oil-powered house may be closer than you think. New developments promise cheaper energy from oil

By David X. Manners

STARTLING new developments in home oil-burning equipment may revolutionize the way you power your house. From the labs come reports that oil will soon be doing more jobs, doing them as well or better than gas or electricity, and doing them cheaper.

Here are some of the goodies the oil

industry is bragging about:

A burner with an invisible flame.
 It needs no chimney, and is so small you can carry it under your arm.

 A hot-air system with a furnace like a jet engine. It distributes heat through ducts only two inches in diameter.

 A more conventional furnace, also chimneyless, that is said to use a third less fuel than an ordinary burner.

 A burner for your present furnace that eliminates noisy flame pulsation.

Water heaters that work up to 4½ times as fast as gas, 8½ times as fast as electricity, and are cheaper to run.

In the labs, and well on the way to the production line, are oil-fired air conditioners, clothes dryers, incinerators, refrigerators, and a home generator that may supply electricity for about half what you now pay.

It is becoming increasingly clear that the gleam in the oil industry's eye is a home in which you'll need only one

fuel—theirs.

What sparked this sudden surge of development, this rush to perfect new equipment? The oil industry is scared. It's been losing out to gas at an alarming rate. To recover lost ground, the big oil suppliers themselves have gone in heavily for equipment research to supplement the efforts of manufacturers. Home heating has received the most attention so far. But the wide variety of research projects underway shows they are determined to get a share of the booming market in power-assisted housekeeping.

Furnace without flame. Two burners soon to appear on the market are totally

unlike any ever seen before. They need no chimney, can be made no larger than the heater in your car, and utilize fuel at a fantastic 99-percent efficiency. One of these is a catalytic burner.

A catalyst, as you may remember, is a substance required in a chemical reaction, but that is not itself consumed or changed by the reaction. In the Pyrocore, developed by the American Thermocatalytic Corp. of Mineola, N. Y., the magic catalyst is a hollow cylinder of porous heat-resistant material. Fuel vapor and air flow into one end of the cylinder, go

Cheaper

through the porous walls and burn at the outer surface. The entire outer surface glows like a gas mantle, without visible flame. Yet a unit 10 inches long and two inches around can give off an incredible 50,000 BTU per hour. Two or more units can be joined to produce as much heat as you want for a central heating plant, or individual units can be placed around the house for direct heating

A complete warm-air furnace in prototype is only the size of a shoe box. A boiler is similarly small. Pyrocore has further home applications for such things as refrigeration, air conditioning and water heating. Marketing of Pyrocore heaters is still at least a year away.

Another compact heater, the Waller furnace designed by William J. Waller of Beacon Falls, Conn., has already been licensed for manufacture, and assembly lines should be rolling this winter. Reports are that first sales will be to large-scale builders, but conversion burners should soon be available.

Somewhat larger than the Pyrocore units, the complete Waller furnace will

Glows like a gas mantle

was of the pyrocore reactor is a hollow cylinder of porous refractory (heat-resistant) material, closed at one end. Fuel vapor and air flow into the open end of the cylinder and pass through the porous walls. Combustion takes place at the outer surface, but there is no visible fire or flame. The surface glows fiercely, producing over 1,000 BTU per square inch.

MQUID FUEL AND AIR under several pounds' pressure are mixed in a carburetor and fed to the burner. From 70 to 85 percent of the heat is transferred to the jacket surrounding the Pyrocore unit. Practically all the remaining heat is recovered in the secondary heat exchanger.

Prefab air system has flexible ducts

COSTS result from the use of small-diameter insulated flexible ducts in the [et-Heet system, These can be installed almost as easily as BX cable. Filtered and humidified air at 350 degrees is delivered to each room register. A venturi system mixes enough room air with it to give required volume and temperature before air enters room.

be a third the size of a standard oil unit, two-thirds the size of a gas unit. Claims are that it will burn just about any kind of liquid fuel, including oil too crude for conventional oil burners, and requires no adjustment in switching from one fuel to the other. Its heating capacity is extremely flexible. A typical model can be throttled way down to 10,000 BTU or opened up to 65,000 BTU.

The liquid fuel is converted into a stable gas before it is mixed with air and before the point of combustion is reached. Air under pressure is precisely metered into the combustion chamber. chamber is tiny compared to those in conventional furnaces-it's measured in cubic inches rather than cubic feet. The

burner nozzle is surrounded by a shell of refractory material which becomes incandescent when the unit is operating.

Both the Waller and Pyrocore units are said to utilize fuel at better than 99percent efficiency. This means that just about every one of the 140,000 BTU you pay for in a gallon of No. 2 fuel oil can be put to work heating your house. With ordinary equipment, if you get 80 percent of this potential heat, it is considered worth bragging about, and 85-percent efficiency is the theoretical maximum at a standard 400-degree stack temperature.

How do these new burners succeed in breaking through this theoretical heat barrier? By reducing stack temperatures

[Continued on page 236]

Draft without chimney

COSTLY HIGH CHIMNEY is eliminated with this packaged furnace by Iron Fireman, Since it doesn't depend on natural draft, there is no warmup period. Thus gives instant clean flame start which allows shorter, more frequent firing periods. Result: more even temperatures. Induced draft also cools nozzle, preventing baked-on deposits—a major cause of oil-burner service problems.

Each year in the U.S., often without warning, homes and highways are buried, pulled apart, or broken to bits by an awesome natural juggernaut: the landside.

HORIZONTAL SLIDE mutilated Nicolet, Quebec, in 1955 when rise in ground water pressure lubricated subsoil layer of clay on gravel.

Only last August, at the height of the vacation season, slides let loose by an earthquake blocked mountain roads and buried several camping parties near Yellowstone Park. Because no one knew just how many tourists were in the area, the exact toll in lives could not be counted.

Earlier, on May 27, near Santa Monica, Cal., a roaring slide heaped more than 600 tons of dirt and rock on the superspeed Pacific Coast Highway between Los Angeles and San Francisco.

Five of the six lanes were jammed. By coincidence, a stop light had halted 50 motorists a few yards from the slide.

In the same area, two months before, a highway workman had been killed when buried by a slide. Two years earlier four women picnickers were swept down the bluff in a torrent of earth but were dug out uninjured.

Search for answers. Since U. S. landslide damage amounts to hundreds of millions of dollars annually, highway engineers have been trying to find out what triggers such roaring rockfalls and

BIG SITE. Entire section of highway was sliced out and shifted seaward above cliffs at Point

Fermin, near Los Angeles, in 1941. Gashes inland warn of still more trouble to come.

determine why they act the way they do.

Now the experts are coming up with some surprising discoveries and some neat tricks for taming the mad mountains.

This is no simple matter, considering the destructive power of slides.

Half a century ago the peaceful town of Frank, in the Canadian Rockies, discovered what it was like to be located at the muzzle end of a major landside.

The rains came. For days they sopped the shoulder of Turtle Mountain, a precariously balanced mass immediately above town. No one sensed danger; rains like that had fallen before. But when the cliff became so saturated that friction could hold it no longer, it broke away and splattered thousands of feet downslope, rammed through half the village, utterly demolished it, and obliterated nearly 70 people. It mangled 7,000 feet of track along the Crow's Nest Railway and roared at express-train speed to the far side of the valley, nearly three miles away.

Until recent years slides were looked upon as little more than what the Chinese

called them: "a time when the mountains walked."

And the Chinese certainly should have known. In the remote province of Kansu, on Dec. 16, 1920, the peasants huddled down that evening in cave homes carved out of high cliffs of soft earth. As night came to the wind-chilled, treeless plains, a tremor joited cliffs and valleys.

The ground cracked, Crevasses opened. Sand gushed out of the interior of the earth. Mountains collapsed. Rivers were dammed. Villages disappeared. One after another, smothering slides poured out over the plains and into the valleys.

The man-made slides. Modern road builders, slicing open the earth's surface, triggered more landslides than ever before. In the battle to keep the roads open, geologists, soil scientists and highway engineers have pieced together some of the mysterious inner workings of falls, flows, slumps, slides, glides and avalanches.

The Kansu slide, they now know, was no more mysterious than the sand in a

WIRE MESH being put up to combat rockfall near Kelso, Wash, The mesh doesn't stop a slide, but keeps rocks close to slope, letting them drop harmlessly into roadside ditch

concrete overcoat: To hold back an unstable slope near Valona, Cal., engineers paved the entire surface. A grid of reinforced-concrete beams below it anchors the section firmly.

METAL RETAINING WALLS have been used effectively on treacherous slopes along new highway construction. Purpose of cribbing here is to keep the roadbed from sinking.

child's sandbox. The internal structure of the silt, normally strong enough to hold together, was shocked by the earthquake into a plastic condition. Great masses of suspended silt flowed like water, as happens on a smaller scale in desert dunes. The difference was that the Kansu disturbance covered thousands of miles and affected thousands of lives.

Once loosened by water (or by any other agent of weathering) all land is destined theoretically to be carried to the sea. This total erosion never happens, because the continents are periodically uplifted. But such mass wasting of land is a continuing process punctuated by some devastating slides.

What do landslides cost? It's hard to estimate. There are such indirect costs as traffic delays, damage claims, and interruptions of public services. Engineers calculate that the total runs into hundreds of millions of dollars a year.

One state alone reports yearly slide damage of over a million dollars, three states just under a million, and six over \$100,000. Water backing up behind Grand Coulee Dam has caused slides costing upwards of twenty million dollars. An oil company in California spent more than a million dollars to control slides in a single field. One railroad company shells out between \$500,000 and \$1,000,000 a year to control and clean up after slides.

Highway threat. Of even more concern is the hazard to public safety. With America's growing road network being designed for high-speed, high-density traffic, one rockfall in the middle of one lane could bring multiple collisions with an appalling loss of life.

Yet highway engineers cannot remove every dangerous mountain. They cannot stop rainfall. They cannot abolish earthquakes. They cannot halt vibration. Only with great difficulty can they retard erosion or alter rivers.

One thing the engineers have learned is that sudden slides are not quite so sudden as they seem. Intensive study in recent years has shown that a coming landslide gives itself away by such telltale clues as road slumps, cracks in the earth, displaced paving, crooked fences.

But these are only surfaces signs. The basic trouble lies deeper. By a careful study of neighborhood rocks, soil, terrain

One tunnel diode (center, magnified) could replace all FM radio parts shown in background.

Tunnel Diodes: **Even Better Than** Transistors

tubes or transistors for TV. FM portables, wrist radios

By Martin Mann

TT'S a slow week in the electronics up with a widget better than the business when somebody doesn't come transistor. This time, though, it looks like for real. The new widget is called a tun-

New super-crystals outperform nel diode. It's a speck of shiny gray crystal. It will do anything a vacuum tube or transistor can, only better, plus a lot of things they can't.

> The tunnel diode should move a lot of enticing products out of the labs and onto the assembly lines: wrist-watch radios cheap enough and useful enough for nearly everybody; telephone-quality mobile radio for cars and taxis; portable, pocket FM radios; inexpensive batterypowered TV sets; simple communications

How the Tunnel Diode Works

The tunnel-diode amplifier is just two specks of crystal, one slightly different from the other, fused together. The key to its operation is the modern picture of the way electricity acts.

The elementary units of electricity, electrons, can have many different energies—but not all different energies. They're like paper money, which comes in values of one, two, five, or 10 dollars, but not 2½ or seven dollars. Electrons are restricted to certain 'permitted' levels of energy, a group of high levels and a group of low levels. Intermediate energies—between the groups—are "forbidden" The exact values of the permitted and forbidden energy levels are different for different materials.

The tunnel diode exploits the differences in energy levels to make a weak signal voltage control a strong current. The voltage does this by shifting electron energies in some side of the diode relative to the other so that sometimes current flows easily between the two, and sometimes it doesn't.

The diagrams at right show how an increasing voltage influences current flow. The energies of the electrons are indicated graphically over a magnified cross section of a tunnel diode.

1. ZERO VOLTAGE, Electron energies are equal on both sides of diode. Electrons "tunnel" back and forth across joint, but just as many go one way as the other. So the net current is zero. Notice that the p-type semiconductor on left side has room for more electrons at low levels, below Forbidden Region. Netype semiconductor on right side has its low levels filled with electrons, and surplus electrons in its high levels, above its Forbidden Region.

via moons (natural or man-made); electronic brains of near-human intelligence.

The impact on television, particularly, could set off a chain reaction. Tunnel diodes promise TV receivers of vastly greater sensitivity, able to produce good pictures far, far from the station. And that could trigger a long-repressed explosion in television broadcasting that would multiply many times the number of sta-

tions on the air. You'd be able to choose from dozens of programs instead of a few.

What's so hot about the tunnel diode?

- It's cheap. An RCA man said, exaggerating only mildly, "You make these things out of the sloppy old germanium they throw away at the transistor factories."
- It's small—a few thousandths of an inch across. With leads and everything, GE's prototype could get lost inside a paper clip.
- It handles electricity at all frequencies, including the extremely high ones where tubes puff hard and transistors fall flat. It's a natural for TV and FM radio.
- It runs on practically no power at all: 1,000 times less than the notably unhungry transistor eats, 100,000 times less than a tube. This means that radios—and maybe TVs, too—wouldn't even need flashlight batteries, let alone power cords. The feeble juice from a sliver of a solar cell would be enough.
- It's quiet. That is, it amplifies extremely weak signals without mixing in static. This is of major importance, a real breakthrough for everything from space communications to taxicab radios and

2. SMALL VOLTAGE. Energies of electrons on n-type side are raised by increase in voltage, bringing them opposite empty spaces in the p-type low levels. More electrons tunnel from right to left (n-type to p-type) than go the other way. A strong net current flows from right to left. At this point, current is increasing with increasing voltage—just as it does ordinarily in a wire—and the tunnel diode doesn't amplify any more than a copper wire would.

3. GREATER VOLVAGE. Energies of electrons on n-type side are raised still more. Some now face Forbidden Region of p-type. Those electrons cannot enterp-type because they can't exist in a Forbidden Region. So the current from right to left decreases. A steady "bias" voltage will keep the electrons in this range of energies, where the addition of small signal voltages causes sharp drops in current, and the diode works as an amphifier to magnify the signals.

4. HIGH VOLTAGE. Energies of electrons on n-type side are raised above the p-type's Forbidden Region. They now face the p-type's higher levels and can flow into the p-type again. Current flow from right to left goes up once more. Here increasing voltage increases current, and the diode is no longer useful as an amplifier. Because the tunnel diode works only over a narrow range of voltage, special radio and TV circuits must be designed for it.

THIS IS A RADIO TRANSMITTER, complete for broadcasting. The tunnel diode is in the can in

the middle. Experimental model was one of several radical devices demonstrated by GE.

UHF television. Tubes run three to 10 times noisier, and transistors aren't even in the same league. Only two quieter amplifiers have ever been invented; both gobble power hungrily and one (the

maser) requires a lab full of magnets and liquid helium (at 454 degrees below zero).

There are a couple of other things, too, that have some million-dollar spenders

1. Old church, foreground, stands next to new. 2. It starts its journey behind a wrecker.

CHURCH MOVES BY LAND AND SEA

The 70-member Episcopal mission at Satellite Beach, Fla., just south of the Cape Canaveral missile base, has a new church. It's an outgrown edifice, the gift of St. Andrew's parish at Fort Pierce.

The 58-year-old structure was jacked up and hauled to the Indian River, part of the Intracoastal Waterway, loaded on a barge and towed 70 miles upstream. The photos above and at right show how the job was done.

The building is 70 feet long, 24 feet wide, weighs 30 tons. The largest load

ever towed on the Indian River, it was navigated through five drawbridges. It fought tides and strong channel currents without mishap. After the water journey, which took 23 hours, it had to cross 500 vards of beach.

The old-new church is considered a real bargain. Transportation and moving expenses totaled \$5,000. It would have cost \$35,000 to build new. And the structure has the distinction of becoming overnight the oldest and most historic building in a year-old town.

ANTIAIRCRAFT BAZOOKA. Here is a guided missile that is fired from a foxhole. It's the Convair Red Eye, guided by heat of a strafing plane's engine. Its launcher, resembling a World War II bazooka, is held on a G1's shoulder.

TRAILER HOUSE, M. M. Hendrix likes the kitchen in his trailer. So he built his home in Parkin, Ark., to fit around it. When he's home, he uses the trailer kitchen and living room. To take a trip, he hitches it to a car and pulls out.

3. Ticklish part of the moving job was getting church over the Fort Pierce seawall to the barge.

blving saucer. The Denise, shown here, is a new kind of vehicle for underwater research. Its French inventors designed it to reach ocean depths to 1,000 feet. They say it is capable of staying down for six hours at a time

PARKING OVER TIME. A sun dial in the yard of the West German patent office in Munich is big enough to park cars on. Time and zodiac lines are white cobblestones. Curves adjust the sun's path to time of year. Time shown: 11:40.

STAPLING gun is like a tiny pile driver that whams in two-legged nails. Squeeze the Swingline tacker described here, for example, and the driver gives the staple a 200-pound wallop. Though it moves only a half-inch, the driver reaches a speed of 36 m p.h.

Regardless of size, a staple needs to penetrate about 1/4" into wood to hold. Longer legs simply allow you to fasten thicker material; penetration's the same.

You can drive about 250,000 staples with the gun shown here—if you hold it firmly against the wood or other material. Then most of the driving force is absorbed by the staple. But playfully firing the gun in air causes the blow to land

entirely on the ram stop, which can stand only about 25,000 such blows.

They've been using stapling guns in industry for about 30 years, but the home handyman discovered them only a short time ago. Now over 6,000,000 are in use. —Erik H. Arctander.

50 POPULAR SCIENCE NOVEMBER 1959

When you squeeze the handle

the handle forces one end of the trigger down, lifting hooks on the other end push the ram upward. This compresses a pair of ram springs. In the base, another spring pulls the follow block against the staples to hold them tightly in place.

NEAR END OF STROKE, ram springs are fully compressed. The trigger is now almost horizontal and slides backward slightly on the trigger pin.

HOOKS SUP OUT of the slots and release the ram. Expanding powerfully, the ram springs propel the ram downward. Driver attached to the front of the ram hits a staple squarely on top, forcing it into the material being fastened. Stop takes up excess energy.

When you release the handle

rest position. Energy for return movement comes from tension on the front end of the main spring, which was forced upward by the trigger's downstroke. Trigger slides forward on pivot pin; hooks engage slots.

When the wind begins to blow, this movie actor tries to make it over to a waiting car . . .

SCISSORS LIFT. The hydraulic hoist above loads cargo on big planes at Frankfurt, West Germany. It can lift 3½ tons as high as 12 feet. It is self-propelled, can be driven right up to a plane and quickly raised to cargo-door height.

BIG-CITY WELL. A billion gallons a day will flow through this waterhole. The caisson—90 feet deep, 90 across—is part of a new Detroit booster station. The 100-ton baffle being lowered into place reduces turbulence from the intake.

MOVIE DIRECTOR BLOWS UP A STORM

When the script of a new French movie, "Picnic on the Grass," called for a big wind storm, director Jean Renoir (son of the famous painter) didn't wait for one to blow up. He had mechanics erect a big fan on the set. It had four-foot propeller blades, capable of creating air currents of 60 m p.h.

This sequence taken from the film shows some of the results. The wind blew one actor completely off his feet and almost took the door off the car. Purists say mistrals are more violent than the one depicted in the film. But 60 m.p.h. was hard enough for this actor.

MISTRAL MACHINE that made the big wind is this fan, which can blow at 60 m.p.h.

. . but is blown back from the door and finally lands on the ground.

PACKAGED FOR SPEED. Here's a sling that pays out battlefield lines at 100 m.p.h.—five times faster than normal. It was designed by the Army for a new, light telephone cable that handles 96 two-way conversations at the same time.

OFFSHORE OIL. This buoy unloads tankers off Stockholm, Sweden. It's an inlet for submerged pipelines that carry oil to shore. Unloading ships can swing all the way around it. The system takes the place of docks and harbor facilities.

How to Loosen

By Walter E. Burton

OT a fitting that's grown fast to its pipe, or a nut rusted tightly on the bolt? Or maybe a wood screw has corroded so it won't budge, or corrosion has united two normally moving parts. Then it's time to try some unfreezing tricks.

The typical rust-frozen joint can look wholly innocent from the outside. A fitting and adjoining pipe can appear clean or only slightly rusted. It may even sport a sound coat of paint, and the visible portion of the thread may look unaffected. But if you could peer between the threads, you would find a dense film of rust that fills every space like an efficient cement—which it is. Before you can hope to separate such a joint, you must destroy that rust film's grip.

Force. Sometimes brute strength, achieved by some simple force-multiplying stunt, is enough to break rust's hold.

To boost the ability of a screwdriver, use a wrench as a lever. Set its jaws over

Singly or combined, these four basic methods will

FORCE Increasing torque with extra leverage is often enough to break the cementing action of rust. But use care; don't apply more force than the tool can safely take. Discretion is also required to keep from breaking or ruining the part you're trying to free.

VIBRATION To start the parting action, a few sharp jolts are more effective than steady leverage. When working with parts that may be damaged, use a hammer with a soft metal or plastic head. Or cushion the parts with a piece of copper or brass.

54 POPULAR SCIENCE NOVEMBER 1959

Rusted Metal Parts

the screwdriver's square or hex shank, or find a hexagonal or square spot on the ferrule of the handle. There are screwdrivers with built-in levers; and a screwdriving bit in a hand brace is one of the most persuasive screw turners. Always clean dirt and rust from the screw slot before trying any turning.

Vibration. Sometimes simply tapping (not whamming) a rusted part with a hammer will budge it. To prevent marring, use a relatively soft hammer—lead, brass or plastic; or interpose a sheet of

aluminum, copper or brass between the work and an ordinary hammer.

Often a nut can be started by holding a punch against one of its flat sides. Hold it at a point where hammer blows on the punch will exert a turning action

Chemical aids. During an expedition to a junk yard, I once found a rusty 10" adjustable wrench whose movable jaw and adjusting nut were tightly locked. I added it to a collection of odds and ends, and went to the weighing platform. The man there picked up the wrench.

unfreeze the most stubborn rust bonds

CHEMICALS Commercial rust-looseners are a good bet. They contain combinations of such penetrants as kerosene, naphtha, carbon disulfide, oil of camphor, amyl acetate, cottonseed oil, carbon tetrachloride and light paraffin oil.

HEAT Here, to part two members, you're relying either on their unequal expansion under heat, or the disintegration by heat of what's locking them together. A few drops of light machine oil around a bolt or screw before you apply the heat may help.

MEATING A FITTING RAPIDLY causes it to expand at a faster rate than the pipe to which it's threaded. Snugging the pipe in a vise close to the joint, as above, helps to keep it cool.

JEWELER'S TRICK for freeing rusted screws in clocks and watches also uses heat: First clean the screw head to improve heat transfer; then press a red-hot rod firmly against it.

commercial RUST-REMOVING SOLUTIONS usually work fast. But in extreme cases you may have to immerse the parts in such penetrating oils for several hours, or even overnight.

"We don't usually sell junk tools," he said. "Our men recondition them."

"That's okay," I told him. "I just wanted to tinker with it anyway."

The attendant looked at the wrench more critically. "This one's a goner," he said, and he tossed it on the scale, along with other nickel-a-pound parts.

I didn't bother to explain that I knew a trick that would make the wrench usable again. Chemical warfare! This simply meant putting some fluid to work that would break down the cementing power of corrosion and possibly add a lubricating action. Old standbys include kerosene, penetrating oil, denatured alcohol and ordinary lubricating oil.

You can also buy special "loosening" preparations which seem to have a remarkable ability to creep into rust-locked joints. Some of these work quite rapidly—often in seconds or minutes. Before squirting or brushing a penetrant on a rusted part, scrape off any surface scale that might interfere with its creeping in. After the loosening liquid has been applied, tapping the nut or other part with

The kitchen-stove treatment-

COOK THE JOINT directly above a gas burner. If the metal has been painted or for other reasons gives off fumes, be sure that the room is thoroughly ventilated. Let the work reach a temperature that leaves it just short of redness before removing it from the flame.

a hammer may help speed the penetration and break the rust grip.

Another chemical stunt, the trick I used on the junk-yard wrench, may work when others fail. This is to soak the rusted article for some hours in a commercial rust remover. In addition to unfreezing parts, it will do away with surface rust. If the piece cannot be immersed, the affected parts can be kept wet by repeated applications of the remover. A typical solvent comes in liquid form and is diluted according to directions before use.

Heat. When other efforts fail, this may be the answer. Heating expands metal, cooling contracts it. The movement is especially effective when one rusted part of an assembly can be made to expand or contract at a different rate than an adjoining part. Heat alone may change the characteristics of the material binding the parts, thus loosening its grip.

To loosen rusty bolts in metal, corroded wood screws, pins, and similar parts, apply heat to the exposed end. Thus, clock repairmen sometimes hold a red-

hot iron rod against the end of a rusted screw for a minute or so before trying to turn it. A little light oil applied around the screw, before heating it, may help. And theoretically it should help if the fastener is made to shrink faster than the surrounding metal, as by applying ice or cold water to it for a few seconds, and immediately trying to turn it. Pressing the tip of a hot soldering iron against the head of a screw is a favorite trick.

Sometimes the shape of a rusted article is such that the outer part can be heated rapidly with a torch to make it expand faster than the inner part, and so break the rust bond. Thus a pipe fitting can be heated more rapidly than the pipe on which it is installed. When heating the part to a high temperature might cause damage, it's a good idea to cool the assembly in a freezer first. Then use warm or room-temperature water to expand the outer portion.

When heating will do no harm, the rusted assembly can be roasted for a while over a stove burner, sometimes even being heated to redness. This

a way to break rust locks that defy all other attempts

QUENCH THE INTERNAL MEMBER of the joint—a pipe nipple, in the example shown—in cold water. This causes it to pull away from the external part by contraction. Wear gloves and keep your hands and face well to the side of the water container to avoid steam burns.

WHILE IT'S STILL HOT, clamp the external part in a vise—or, in the case of small objects, continue to hold it with pliers—while you back out the internal part. A few drops of penetrating oil belp in this operation; apply them before you put the heat on the work.

alone may be enough to loosen the joint, often separating it before it cools. When construction and materials permit, the inner part of the rusted assembly—such as the pipe or nipple in a fitting—can be shrunk by dunking it in cold water

Caution: When a hot pipe is quenched, steam and hot water may shoot out of the upper end with considerable force. Handle it accordingly. Do not use the quenching treatment on metal (such as cast iron) that rapid cooling might damage. Avoid heating steel that has been hardened and tempered, unless you plan to reharden it after the rust problem has been licked.

The works. In very stubborn cases you might try a combination of the foregoing treatments. I found this necessary for a badly rust-locked joint between a tee and a length of $1\frac{1}{2}$ pipe. Force wouldn't budge it. Two kinds of penetrant failed to unfreeze the threads. Then I heated the assembly for 20 minutes on a gas hotplate, clamped the tee in a vise while it was still hot and applied a long-handle wrench. The pipe section grudgingly moved a little. The rust seal had broken! But the turning was difficult; and so, now that the metal had cooled somewhat, some penetrant was squirted around the joint to ease the remainder of the operation.

Compound used in assembling pipe may cause joints to stick. Some penetrants soften such compounds. Another way is simply to heat the joint.

When rust-locked parts have been separated and cleaned, future trouble can be lessened by applying something to their surfaces that will discourage corrosion. Machine oil or cup grease should not be used on lines and fittings that carry fluids or gases that might react with them.

There are commercial rust-preventing solutions (such as a semisolid grease in a solvent) that seem superior to ordinary oils. One such preparation has kept automobile bolts and nuts rustfree for the life of the car. Other rust-preventing preparations that have been suggested by various authorities for threaded and other joints include pipe-thread compound and lard-and-graphite mixtures. Use linseed oil on screw and bolt threads.

WITH this wiring system, you can turn off the garage light from the house—and not interfere with the garage's own electrical outlet. Yet the system takes only four wires instead of the five usually required for this convenience.

The saving comes from making the light and the outlet share a common

Tripod Tepee for a Youngster

ONE way to keep a small child contented when confined to the home is to provide him or her with a play tepee. One can be constructed in a few minutes by wrapping and pinning a blanket or sheet around the legs of an opened camera trippod.—G. E. Hendrickson, Arygle, Wis.

Trick That Saves Wire

ground wire. This single wire can be insulated with type TW plastic, rubber or neoprene, depending on what's locally acceptable for direct burial.

The cable is the plastic-covered UF type, containing a bare ground wire in addition to three insulated conductors. The bare wire is used only for grounding

conduit and boxes to conform to code.

Both wire and cable must be buried in the same trench, and protected by a board if subject to injury. Where they're exposed between building and earth, they're protected by conduit.

The same wiring method can be adapted to serve an outlet on a post light.

Storing TV Tables in the Kitchen

STORING TV tables under the kitchen counter need not mean giving up drawer space. Albert Peterson of Venuta, Cal., solved the problem by cutting through the toe-strip and attaching it to the door. —Earl Stowell, Gardena, Cal.

DETEN a socket-wrench universal joint is too supple to maneuver to the bolt or nut. Wrapping it with a layer or two of friction tape will stiffen it, yet provide the flexibility needed to turn the socket after the wrench is fitted and the nut started.—Chester Johnson, San Francisco.

The sound improves and the set looks better if you build a

Speaker Base for a Table TV Set

THIS plywood base makes a table TV look and sound like an expensive console. How? Simple—the matching base is actually a tuned enclosure designed for a 12" high-fidelity speaker.

Specific dimensions depend on both the TV set and your new speaker. Minor variations from the dimensions shown, however, won't spoil the cabinet's sound.

Keep in mind that most floor-model TVs stand about 40 inches high. And remember that the height of the new base must be at least two inches greater than the diameter of the speaker you use.

The instructions that come with the new speaker, plus some pencil-and-paper work, give specific dimensions for the port, speaker opening and bolt spacing

Line the back and half of the interior of the enclosure with sound-deadening material—carpet padding, glass fiber, acoustic tile, or blanket insulation.

To connect the new speaker to the TV set, run insulated lamp cord or TV leadin from the new speaker's binding posts to soldered connections at the old speaker's voice-coil lugs.

For best results, replace the TV output transformer to match the new speaker. If you prefer, this is a quick job for a TV serviceman. And for a final touch, you can tune the port with the Popular Science Hi-Fi Test Record by connecting the speaker to your phonograph system.

Short Cuts and Tips

Speed Key for Lathe Chuck

To adjust the jaws of a three- or four-jaw lathe chuck quickly, file a square end on the shank screw of a hand drill and use it in place of the regular key. You will still be able to screw the drill chuck back on for normal use, as plenty of threads will remain on the shank above the squared end.—H. J. Gerber, Stillwater, Okla.

WHEN the time comes to remove your Christmas tree, use a pair of pruning shears to snip off its branches. If you cut them small enough, you can put them all in a container which can be carried outside without dirtying the house,—

Edward Rentley, Jackson, Mich.

I had a number of lag screws to drive so I tried chucking the square heads of the acrews in the jaws of a hand brace. The brace made short work of turning them home, and the firm grip gave me complete control over the angle of insertion.—Gerard P. Liets, Chicago.

Spring Keeps Chuck Key Handy

I was always looking for the chuck key for my electric drill, until I tied it to the drill with a spring. I fastened one end of the spring under one of the name-plate screws, and bent a loop on the other end to fit the stem of the key. The spring stretches easily to reach the chuck.—R. W. Pedersen, Boyd, Minn.

Five-and-Dime Frame Clamp

A LITTLE hand work with pliers can transform four angle brackets, four turn-buckles and some coat-hanger wire into a handy picture-frame clamp. A surprising amount of pressure is exerted on the frame corners when the turnbuckles are tightened. But be sure you tighten them evenly.—George A. Thompson, Dallas.

Short Cuts and Tips

Make-Your-Own Cigarette Filter

CIGARETTES without filter tips can be filtered by stuffing a pipe cleaner in an ordinary cigarette holder. Wind the cleaner tightly around a toothpick, slip it in, then remove the toothpick. Discard the cleaner when it becomes discolored.

—Ken Kramer, NYC.

Hose Springs Plier Jaws Open

A SHORT length of hose will make pliers open their jaws automatically when you release your grip. Slip one end of the hose over each of the handles to form a loop that acts just like a spring.—Ann Zawistowski, Coon Rapids, Minn.

Up-and-Down Chopping Tool

When an old axe head developed a crack beside the eye, I cut through it below this point and welded one end of a heavy bar of flat iron in the slot.

The result is a hefty, weight-loaded blade that makes fast work of loosening hard earth, cutting roots in postholes, chopping holes in pondice, and cutting low brush —D. E. Henry, Oquancka, Ill.

Bucket Grip Can't Slip Off

A PIECE of hose makes a good grip for carrying heavy loads in a pail, but it often keeps slipping off the handle. If you cut a spiral slit down the side, instead of a straight one, the grip won't come off.—Daniel Bousha, Jackson, Mich.

Easy Way to Ground an Outlet

THE three-hole adapter plugs that come with power tools and appliances are a

nuisance to use and their protection is usually lost because most people never bother to attach the ground wire. I save the bother by permanently wiring several adapters to the cover-plate screws of outlets around my home, shop and garage. They're always handy and can't get lost .- Al Melling, Brooklyn, N. Y.

What you should know about sheet polyethylene—

The Plastic Film of Occumtless Uses

TOME owners who dismiss polyethylene as just another plastic film have some surprises coming. Polyethylene film isn't like the older, more familiar acetate or vinyl films. Here's why:

 It's tough. A sheet of polyethylene only .006" thick will hold more than 20 pounds' pressure per square inch—a tensile strength better than that of steel in the same thickness.

 It's waterproof. Moisture doesn't get through it, even in vapor form.

 It's chemically inert. There are a few solvents that will weaken it somewhat, but

FILM IS TOUGHER than most plastics, resists punctures and tearing. It stretches under strain, returns slowly. Strain must be evenly distributed along edges by wrapping around support or clamping under battens.

Poly Bag Suffocations:

RECENT suffocations caused by polyethylene dry cleaners' bags shouldn't make you shy away from all polyethylene. Some dry cleaners have used bags only .0006" thick. It's this extreme thinness that makes the bags susceptible to static electricity, and makes them cling. The film you buy by the foot at your hardware store probably will not be less than .002" thick.

even these evaporate and leave the film untouched. Such chemicals aren't found in household use.

 It's big. You can buy single seamless sheets big enough to cover a city lot, without resorting to special orders.

 It's cheap. A sheet big enough to roof a one-car garage costs less than \$10.

 It's light. The weight of 1,000 square feet of the heaviest film is less than 30 pounds.

 It's flexible. Even in cold weather, you can fold a 9'-by-12' poly drop cloth into a pocket-size package.

 It won't rot. The only natural enemy of polyethylene is ultraviolet. And this is whipped by dying the stuff black to make it reject ultraviolet rays.

It's readily available. Major manufacturers' by-the-yard films are commonly sold by lumber yards, hardware stores, farm-implement and mail-order houses.

All these wonderful attributes don't mean a thing, however, if polyethylene film isn't selected and used properly.

Where to use it

FAST TEMPORARY CLOSURE for hole in wall or roof during remodeling project is easy with large sheets. One piece can cover a roof. STORE LAWN FURNITURE ON THE SPOT under cocoon of plastic. Weight of furniture will anchor film. Black film lasts longer outdoors.

ISA POPULAR SCIENCE NOVEMBER 1959

Where to buy it

YOU CAN BUY FILM BY THE RUNNING FOOT; some is edge-marked for easy measuring. Rolls also come in dispenser boxes.

Its qualities must be respected to be rewarding.

Thickness is important. You'll find polyethylene films most generally available in two-, four-, and six mil (.006' thicknesses. Most readily available widths are three, six, and 10 feet, although it can be had in two-foot multiples up to 40 feet.

Common roll lengths are 50 and 100 feet, but most stores sell film by the running foot. And don't let the narrow rolls on the store's racks fool you—han dling and shipping demands that larger widths be folded before rolling

In addition to varying in width and thickness, poly film varies in color. Some

WINDSHIELD STAYS FROSTFREE if protected by a piece of film held by doors. I ighter-weight films can be used for this purpose, ice shakes off

HOUSE PLANT IN PRIVATE GREENHOUSE of vaporproof film will live indefinitely without additional watering. Bag is foliced over, then stapled.

—the super-thin packaging material—is almost crystal clear. Thicker sheets run to milky transparency.

The film is made in white expressly for concrete curing. It reflects sunlight to slow evaporation. It's made in black, too. The darker color helps thwart the ultraviolet rays that deteriorate polyethylene.

The film can be—and is—made in almost any color. Only the natural and black are available at retail stores. The opaque white is offered commercially only to industrial suppliers.

Price depends not on color or width but on thickness. The 2-mil sheet goes for about a cent a square foot, four mils for twice that, and a square foot of the heavy six-mil stuff sells for about three cents.

These prices are one reason for the film's popularity. Generally, they're lower than those of the building felt or canvas that poly replaces. Low cost, plus the unique properties of the film, make it an ideal material to keep handy in the home shop or garage. You'll find that even small scraps never go to waste.

Polyethylene film comes in large sheets

waterproofs wooden box to make a skating rink that won't leak during a thaw. Polyethylene sheet is protected from skate blades by 1"-by-6" wood bumper. Same technique can be used to make oversize photo trays or tanks. A sheet of film lining a wood or eard-board box waterproofs it.

Ceramic Tile

fix-it file

How to replace a broken tile

putty knife or an old chisel, taking care not to gouge the plaster wall. Try the new tile (center) to be sure you have about 1/2" for

the fresh adhesive. One convenient waterproof adhesive comes in a tube. Squeeze an ample amount on the wall and be sure to spread it evenly over the space.

PRESS THE NEW TILE IN PLACE after squeezing several gobs of adhesive on its back. Place a straightedge over it to be sure it is flat, and flush with the surrounding tiles.

YOU CAN'T OBTAIN MATCHING TILE, select a contrasting color or decorative design. Maintain grout space by inserting two nails beneath the tile until the adhesive sets.

How to repair a smashed corner

REMOVE DAMAGED THE and quarter-round corner strip. If plaster wall has been broken, repair it (left) with a mortar mix of one part portland cement to one or two parts plaster sand. Soak the replacement tile in

water, butter it with the same mortar (center) and press it in position. Slip spacers beneath bottom edge of tile and hold it in place with wood strips and masking tape (right) until mortar sets. Remove tape gently.

Renewing the grout between tiles

DIG OUT OLD GROUT with a screwdriver. Mix dry grout with water until it's like whipped cream, Dampen the cracks and brush the grout into them (left). Work the grout into the spaces with a damp cloth (center), then

run the tip of your finger or the eraser end of a pencil along the grout lines (right) to make them slightly concave. Wipe the surface of the tiles clean with a soft, dry cloth before the excess grout hardens.

General upkeep and stain removal

A CRACK DETWEEN A TILED WALL AND TUR often occurs when the tub settles. If possible, beef up the supports to make the tub firm. Otherwise, clean the crack and fill it with a flexible crack scaler that will move with the shifting of the tub (left). Most stains on tile can be removed with household cleaners. For rust stains use a thin paste of oxalic acid and let it stand for 10 to 20 minutes (center). If grout tends to stain, scrape it out and renew it with grout mixed with mineral pigment to color it (right).

New Covers for Tubular Dinette Chairs

ORE than 35 million plasticcovered, tubular-frame chairs were made in the last 15 years. With so many of these popular little chairs around, it's well to know that a sudden rip in the vinyl, or a cigarette burn, needn't put a dinette set out of business.

Putting on a new plastic cover is actually easier than conventional furniture upholstery, although many people don't realize it. And it can be done for as little as \$5 for a complete set of six chairs.

Two secrets make the job a snap:

1) You heat the vinyl first so that
it conforms neatly to curves and

This press is the secret to a smooth, tight job

SIMILAR to presses actually used by furniture makers, this one can be made in a few minutes. By hooking the cross dowel into the boles on one side and the slots on the other, you can adjust pressure on any size of chair seat or back. This squeezes the padding while you staple the plastic in place. When the pressure is released. the padding springs back, stretching the plastic taut for a smooth job.

1 CUT PLASTIC TO SHAPE FIRST so that you can use it immediately after it's heated. Lay out the seat, with padding and the vinyl sheet underneath (photo and sketch at top), and trim the plastic 3" oversize all around. Then warm plastic over a radiator or heat duct for several minutes to soften it (do not use oven or range, as intense heat will melt it).

2 CLAMP SEAT IN PRESS, then start at a corner and pull heated plastic up over it (top). Stapling gun is quick, but tacks can also be used. Keep pulling material taut as you work along sides to remove all wrinkles. If plastic cools and won't smooth out, warm it with a light bulb. Note that bar in press rests on a block, not seat itself, to leave working room.

rounded corners without wrinkling. 2) You build the simple press as shown from scrap wood and a broom stick to hold the work firmly in place while you pull the plastic taut around the edges. The rest is a stapling job.

Buy a good grade of 12- or 14-gauge

vinyl. You'll need about ¾ of a yard of 54"-wide material for each chair—three yards for a set of four chairs, 4½ yards for six. At the same time buy 2"-thick cotton batts for new padding—enough to cover each seat and back with 1" to spare around all edges.

3 MAKE A NEW WELT by stripping old plastic off original welt, leaving the cord. Cut new strips of plastic 1" wide and as long as cord. Fold the plastic around the cord (top) and staple it to lower edge of seat, starting at

COVER SEAT BACK in the same way as the 4 seat, but because it is curved, lay it over another back or block it up for support, then tighten the press against it (top). For the rear of the chair back, cut a sheet of heavy cardmiddle of back. Bottom of seat can be covered board or fiberboard slightly undersize. Wrap with black cloth if desired, Proof of wrinkles the sheet with plastic (sketch above) and less job is seen in lower photo above.

A QUICK PAINT TOUCH-UP can be given chairs' tubular frames while the seats and backs are semoved. Black or metable lecquer in a spray can goes on easily and amouthly, dries fast.

7 Quick Tips for Chair Repair

SQUEAKS MAY OCCUR when the seat rubs against the frame of a tubular chair. One fix: inner-tube rubber between seat and frame.

RUBBER

DECORATIVE UPHOLSTERY TACKS can be driven without damage to the head if you use this tool: a short piece of broomstick with a hole drilled in one end.

LEVEL A WORSLY CHAIR by putting a gob of wood putty on waxed paper on a level floor. Press the short leg into outty until it is even with the other legs. Trim off excess putty, sand smooth.

RUNGS SHABBY because growing youngsters book their feet and heels over them? Slit a piece of large-diameter hose lengthwise, slip it over rung, and fasten with bands of tape.

CUTTING OFF LEGS of a stool or chair? A mailing tube will help you get a level job. Measure off desired leg length on tube and saw part way through at this point. Slide the tube over each leg in turn and use the kerf on the tube as a guide as you saw off the leg.

FOR A DAMP SPOT where legs of chairs and tables may rot away, nail or screw small blocks of wood to the legs as shown in photo above.

TO TIGHTEN A LOOSE RUNG when all others in the chair are snug, push the loose joint together, drill through it with a small pail, cutting off the noil so that it will be below surface on both sides of the leg. Then fill the holes with putty.

172 POPULAR SCIENCE NOVEMBER 1959

Fan Hood Dries and Defrosts

Wer parts such as film-developing reels will dry completely in a few minutes when dropped into this fan hood. Frozen-food packages will defrost in half the normal time. Just cut the top and bottom from a one-gallon can and wire the can to the blade guard on any electric fan.—Murray Kent, Detroit.

Thumb-Indexing Book Pages

I USE a finetooth rattail file to make index notches in the edges of my reference books, including bound copies of PS. A number of light strokes inclined at a 45-degree angle form tapered thumb holes.—Fred Duncan, Moorestown, N. J.

Low-Cost Anvil from I-Beam

In My shop, I have only occasional need for an anvil—not enough to buy one. For these occasions, I bolted a foot of 8" I-beam to the top of my bench. A piece like this can be picked up at a junk yard for little or nothing.—Joseph D. Campbell, East Alton, Ill.

"Feet" Prevent Ladder Slip

Parallel for Drift Press

A FIRM parallel support for elevating work above the drill-press table can be bent from a strip of \(^{\alpha}_{\theta}\)"-by-1\(^{\alpha}_{\theta}\)" steel. If the edges of the strip bulge where you bend it, file them flush with the straight parts. Being one piece, this parallel won't rock or tip.—F. Murray, Chicago.

eye comfort: Arranging Your Shop

Why This Article Is Important

Eye comfort in a shop is more than just a matter of working efficiency. It's a matter of safety, too And where close work is necessary as it is in virtually every shop, it is vital to eye preservation.

Dr. Gregg, author of this article. was a member of a research team that made a two-year study of more than 200 occupations and avocations to determine the visual needs of each

"We found that hobbyists in their home workshops have intense and unusual seeing problems," says Dr Gregg. He adds: "And we found that these problems are seldom solved satisfactorily "

Dr Gregg is a former president of the California Optometric Association. Currently, he is an associate professor at the Los Angeles College of Optometry

OPERATING HIDDEN CONTROLS is one of the toughest shop jobs. It's especially hard with bifocals because you must bend low and arch head back to see. Good lighting on tools, as here, helps whether or not you wear glasses.

By James R. Gregg, O.D.

YESIGHT is your most valuable shop tool. But chances are it is neglected unless you give attention to how well your work area is designed for seeing.

If your eyes can do their job with ease, your hobby will be more fun-and more profitable, too—because you'll work with less error and fatigue. Here are some tips for better seeing in a shop:

Use balanced lighting. Two kinds of light are necessary for good seeingspecific light right on the work and general room illumination. Eves that have to adjust from high brightness one moment to dimness the next will tire quickly.

A bright spotlight on the work with the rest of the room dark—a common shop situation—causes strain and fatigue. Be sure the entire room is illuminated.

Get enough light. The central working area, a bench or a machine, needs at

Good lighting pays off

DON'T WORK IN YOUR OWN SHADOW, Conventional ceiling fixtures are often low and behind you, don't light a bench well. Hang extra lamps, preferably adjustable so you can raise and lower them, directly over work areas.

for Better Seeing

least 20 to 30 foot-candles of light. That's about the amount supplied by an uncovered 100-watt bulb 31/2' to 4' away. In a lamp at ceiling level, it may take 200 watts or more to give the same lighting.

General room illumination is seldom high enough for critical seeing jobs. It is best to have an adjustable lamp right over the work area as well. It doesn't matter what kind of light you use-incandescent or fluorescent—so long as there is enough of it.

Eliminate glare. Glare is as bad as not enough light. Eves are attracted to bright areas and can't concentrate.

Exposed bulbs, found in many home shops, should be shaded. Most modern lamps with built-in bulb covers and reflecting shields minimize glare. Shiny surfaces, overly bright windows and any other distracting sources of glare should be eliminated. Indirect lighting, although often expensive, is the best for reducing shadows and glare

Paint surfaces light. Unpainted surfaces, whether wood or concrete, are generally too dark and don't reflect enough light. Use light-colored paints on walls, ceilings, floors and benches to diffuse and distribute more light throughout the room. The colors you choose aren't important so long as they're light; but use flat, dull finishes to prevent glare.

Your central working area should never be more than three times brighter than the surrounding area. A shiny metal part on a dark bench or machine will be too much brighter than its background. A light paint job brightens surrounding areas and keeps down too much contrast.

Center your work. Eyes work best if each one sees the job at the same distance, with the work centered instead of off to one side.

Normal reading position illustrates this nicely: The book is centered on the body. well below eye level, and is tilted so the page is nearly perpendicular to the line

in greater accuracy, less strain

TOO MUCH CONTRAST between a bright spotlight on the work and a dimly lit room causes eyes to strain in abrupt switch from light to dark areas, Provide a high level of general illumination as well as lamps for specific jobs.

PAINT WALLS AND WORK SURFACES in light colors so they more closely match your workusually light-colored wood or metal. This lessem eye strain from excessive contrast between light and dark areas, also brightens the shop.

Arrange tools and work areas to match your best eye-distance

TOOLS COME IN STANDARD HEIGHTS—people don't. A work surface that's too low will cause tiring stoop and squint; if too high, work will be too close for comfortable seeing and cause awkward back-tilt of your head. Once you've found the working distance that's right for you, adjust work tables and benches to proper height by blocking them up or cutting them down.

a helper measure while you try out most comfortable positions. Take an average of five tries for final measurement. The usual working distance is 16" to 18" but it can vary widely for different people and different types of jobs

slightly downward direction so both eyes see it from the same distance and head tilts comfortably, as at left. Note how this is almost identical to the way you hold book (above) for easy reading. For wearers of bifocals, this puts work where it can be seen through lower lenses.

of sight. Tables, jigs, benches, and machines should be adjustable to approximate the normal reading position, even tilted when this is possible.

Power tools are standardized at 36" to 40" high. But home craftsmen don't come in standardized sizes. Whether you stand or use a stool, have the work area adjustable so that it is not necessary to bend over to see at your comfortable seeing distance. You can work and see in an abnormal position briefly, but if you stay at it, adjust the work to suit your personal habits.

Store tools for best visibility. Whether or not you wear glasses now, somewhere

in your forties you'll have difficulty seeing up close. This is because the eyes lose their normal ability to focus on near objects—and it happens to just about everybody. Eventually this leads to reading glasses or bifocals. Once this happens, most glasses won't solve all the problems of reading labels, selecting small parts, or seeing accurately in a wide variety of locations—especially if the glasses were made for another job.

You can minimize this difficulty by proper arrangement of your shop. Keep small tools and parts on shelves or in drawers within easy arm's reach and never above eye level. Print labels large.

The most difficult seeing area after your mid-forties will be above eye level and farther away than 24" to 36". Put large tools in this "difficult" area—you'll always be able to see them, even if not perfectly clearly. Keep small objects low and close where they can be spotted

[Continued on page 242]

Are Your Eyes Up to the Job?

It takes more than 20/20 vision for good seeing in the shop. Eyes must focus strongly, sharply and without tiring, for accurate detail work.

Any of the following signs may indicate deficient eyesight for shop-work and should be investigated immediately:

Blurred vision of near objects.

 Headache or tiredness associated with use of the eyes.

Double vision.

 Inability to line things up or judge distance.

Errors in cutting, sawing, measuring, or frequent mistakes of any kind.

Listleseness and loss of interest.

How to live with bifocals in a home shop

THE PROBLEM: Small objects viewed close, especially fine print, must be seen through the lower lenses—yet the equipment in many shops in effect is arranged topsy-turvy, with tiny parts kept high on shelves or in jars against the ceiling. This forces the bifocal wearer to strain upward and tilt the head awkwardly back to bring the small objects into correct focus.

THE SOLUTION: Keep small parts on the lowest shelves, in bins built along the front edge of a bench and in drawers underneath. You need only look down, without moving your head, to see them clearly through the lower lenses. Store large tools high and at back of bench where you can spot them, even if not clearly, through distance lenses in upper part of the glasses.

Siamese Cameras Double Your Chances

FILM 13 ADVANCED in both cameras by turning a single knob. A coupling shaft, passing through light-tight bushings in the sides of the paired cameras, joins the two winding posts.

A RIG that pro photographers will find more useful than an extra pair of hands has been devised by a camera repairman, It's a brace of cameras interconnected so they operate as one.

Only the shutter speeds and diaphragm openings are changed individually; other controls are coupled for single-knob operation. With the Siamese-twin cameras you can simultaneously shoot:

- Color and black-and-white
- Fast and slow (fine-grain) b. & w.
- With and without a filter
- At different shutter speeds
- At different diaphragm openings

Fred Weiner of Photokraft Co., 133 East 43 Street, NYC, got the idea from listening to his professional customers, many of them magazine photographers.

178 POPULAR SCIENCE NOVEMBER 1959

DIFFERENT SHUTTER SPEEDS used in snapping a moving object give photographer a choice be-

tween varying amounts of blur. A single click caught this car at 1/100 sec. and at 1/300 sec.

He chose Rolleicords because they're well-made, and prewar models because they're simpler than more recent ones.

Strobe can be plugged into one set of external connections. The two shutters are so synchronized, however, that even at different speeds, the light source is triggered only when both are open.

Weiner had a combination of color and b. & w. in mind when he made the rig. But he also knew that pros shoot a scene with various speed and opening combinations if they can. Because the dual camera doubles the number of pictures taken, there's less chance of missing those "safety" shots. It's especially useful in photographing motion: Getting just the right amount of blur often takes trial shots at a range of shutter speeds. If the picture is staged, you must rerun the action completely for each shot-which takes time.

DIFFERENT LENS OPENINGS produced a soft-focus and a sharp-focus portrait at the same time. The lens on the left-hand camera was opened wide; the other was stopped down to f. 16.

STEREO PRINTS were made by using identical exposures on the same kind of film. The unintentional bonus resulted from angling cameras together slightly to correct for parallax.

Tips on Getting Rid of Mice

A BOOKLET on mice control put out by the Alumni Research Foundation of the University of Wisconsin recommends a double-barreled approach simultaneous use of traps and anticoagulant baits. Copies are free from the Foundation, Box 2217, Madison, Wis.

PLACE TRAPS SO MICE HIT TRIGGER whichever way they approach in runway. This usually means putting it crosswise in runway. Bait for the traps? Just about any food—or use a piece of cotton. (Mice like it for nest making.)

SAFEST BAIT is an anticoagulant such as warfarin, discovered at the University of Wisconsin and now available under various trade names in your local stores. It comes in two forms ready-mixed in cereal, and water-soluble. Illustrated here are ways you might use both types. Cut a doorway in one or both ends of eigar box, drop in a handful of cereal bait. Or place both types of bait in a self-feeder box, center Right, a lean-to protects bait and trap. Warfarin-weakened mice are easily caught, reducing chance of dead-mouse odor in the house,

by making sure that windows and doors near ground level fit tightly. Use metal flashing at door bottoms. Make the doors self-closing. And cover all openings around pipes and foundation with cement or ""-mesh wire screening (hardware cloth).

Steel Ball Keeps Spray Paint Mixed

A COOD-SIZE ball bearing dropped in the paint cup will help prevent paint from settling while you're spraying. The side-to-side movement as the gun is used will keep the ball in motion, agitating the paint.—Ken Murray, Colon, Mich.

Tube Shoots Nails Into Corners

THE piston inside the nail shooter shown in the sketch above will drive home nails in places where there's no room to swing a hammer. The tube holds the nail.—Cecil F. Cooper, Morehead, Ky.

HOLLY wreaths and decorations will last longer and have more luster if you give them a thin coat of synthetic resin sealer or spray-can plastic.

EVEN when my auto is exposed to sub-zero temperatures in the carport, I have no trouble with cold starts. What does the trick is a vent leading from our clothes dryer out through the house wall, close to the engine. On frigid days I turn on the dryer for a few minutes, and the warm-air exhaust gives the starter just the encouragement it needs to turn over.

—James D. Feldman, Park Forest, 111.

Cure for Noisy Electric Clock

You often can quiet a noisy electric clock by turning it upside down for a day. This recirculates settled oil. If that doesn't work, remove the gear unit. Warm it slightly, put a drop of oil in the shaft cup, and place it in the refrigerator for about five minutes. Cooling the air within the unit draws the oil in. When the clock is connected, this oil circulates.—

Edward Bentley, Jackson, Mich.

Sanding

By Jerry Parker

Your shop for less than a quarter, thanks to the first really new development in sanding in a long, long time It's the radially slotted sanding disk.

It turns a tiresome task—hand sanding odd shapes, moldings and flutings—into a fast power job. Best of all, flutter and spool sanding (the two slotted-disk techniques) work with power tools already present in many home shops. You need buy only the disks themselves.

The disks have a special backing, flexed during manufacture so they'll be pliable enough to stand up during use. Either eight or 16 cuts run from the outer edge of a disk nearly to the center.

Tom DeLappe, a veteran cabinetmaker of High Point, N. C., is the man to thank for the new technique. He invented the disks to solve a common furniture-factory problem: the high cost of unavoidable hand sanding on ornate shapes.

For production use, DeLappe disks are mounted on belt-driven spindles under dust-collecting chutes. A shaper, or comparable table arrangement, is the usual thing where support is needed.

In the home shop, the disks can be used on a circular saw or a motor shaft, a drill press, flexible shaft, or even a portable electric drill. Which one you use depends on what's available, and whether or not the piece needs support or guidance.

Flutter sanding calls for nothing more than a pair of the new disks mounted between two washers. A couple of special washers or the ones already on a circular saw will do the job for you without other changes.

Flutter sanding offers the most flexibility. It's used on intricate routings and contours, and on delicate and fragile carvings. Two eight-slot disks are placed

with Slotted Disks

one over the other, facing the same way (they last longer when used in pairs). Then the disks are folded to form a pin-wheel. Ideal running speed for 6" disks is about 3,400 r.p.m.—normal saw speed.

Spool sanding requires only the addition of a felt supporting spool. This is simply a buffing wheel of hard felt, with a thickness, diameter and bore size to match the disks and the work.

Like the furniture factories, you may find that it pays to keep on hand a variety

of these wheels in different shapes and sizes. Frequently, odd lots of surplus felt wheels appear on the market at bargain prices.

The spool-sanding setup gives the slotted disks greater firmness. It's less flexible, of course, for following involved forms, but it cuts faster. And you can do a certain amount of shaping and carving with it.

The approximate 1,750 r.p.m. typical of portable drills and workshop motors

How to use the new radially slotted disks

PLUTTER SANDING takes a pair of eight-wing disks clamped between washers. Corners are folded in same fashion as a child's pinwheel.

SPOOL SANDING takes 16-wing disks, folded over a felt buffing wheel. Spool sander cuts fast, can be used for shallow carving and shaping.

is a good one as well for spool sanding

Although factory-made disks work best and last longer, you can try out this sanding method with an ordinary sanding disk. Cut eight slots in it and fit it

to your arbor with washers.

The commercial disks aren't on sale vet at all retail outlets, but you can outain them from the Kambro Paint and Hardware Corp., 1185 Avenue of the Americas, NYC, Kambro has arranged to handle inquiries and mail orders for the manufacturers of the disks, the Behr Manning Division of the Norton Company

Six-inch disks are the most generally useful ones in the home shop. For flutter sanding, these should be eight wing; for spool sanding, 16-wing. The backing recommended by Behr-Manning is called "double-flexed J-weight cloth

The disks are priced upwards from about 15 cents, depending on size and grit

A good all-around abrasive choice is open-coat garnet in 2 0 grit. If you make considerable use of the new techniques. you'll probably want to add other grits, perhaps 1 0 and 3 0.

Removing paint is a breeze

SPOOL TECHNIQUE removes paint without change ing shape of work. Here it's used on a relatively flat surface otherwise aceding band sanding

Flutter sanding's deft touch saves work

REMOVING PAINT FROM TURNINGS, a headache when rehushing furniture, is an easy job for flutter sander mounted in flexible shaft or drill.

WORN DISKS used in flutter sanding can be rejuvenated by frimining them to a smaller circle. Sharp corners are needed for really fine work

with slotted disks and spool sanding

SHAPER TABLE is used commercially to support work while flute is sauded. Home-shop equivalent is an arbor mounted in a drill press.

BELT-DRIVEN SPINDLE, shown here power sandong delicate flutes, can be duplicated in a home sloop by mounting arbor on a motor shaft.

New technique speeds furniture making

DUAL-SPINDLE ARRANGEMENT in furniture plant speeds production work, can be duplicated in home shop by using both shafts of an electric

motor. Hanging on the machine is a wide variety of felt sanding spools to ht differing needs of work and many sizes of slotted disks.

Safety Hook on Ladder Shelf to Prevent Accidental Spilling

When I inadvertently tipped the shelf of a stepladder that held a can of paint, I found out—the hard way—how much surface a quart would cover

To avoid a repetition of the disaster, I made a lock for the shelf. I nailed a tapered block to one of the step rails and on its vertical side installed a C hook cut from 18-gauge sheet steel. The hook is put on with one nail so it can be swung under to hold the shelf extension.—Gale L. Ferguson, Bradenton, Fla.

Crashproofing a Radio

A CLOCK radio can be protected from accidental tumbles by this holster arrangement. It cannot be pushed off the stand, but can be easily lifted off for dusting.—Richard Lefever, York, Pa.

THAT fancy Christmas-gift decanter will make an unusual decorative piece, especially pretty in sunshine. Simply fill the decanter with water, and add a few drops of vegetable coloring. The color can be changed frequently.—Maurice T. Ehinger, Fort Wayne, Ind.

Plating a Soldering Iron

ONE of the best means of keeping a soldering iron brightly plated is to use a common brick. A slight cavity is chiseled into the brick, and the depression kept filled with drops of solder. A thimble-ful of powdered resin may then be melted with the solder and the hot iron worked back and forth to tin it. This is a trick I saw used 30 years ago by an old-time tinner whose soldering copper was an extension of his right arm. He transferred solder from the brick to his work.—Raymond Winburn, Lee's Summit, Mo.

A Simple Sheet-Metal Brake

HERE'S a homemade sheet-metal brake that will repay you many times for the hour it takes to build it. It forms accurate bends as long as 18 inches in half-hard steel up to 26 gauge, and in soft aluminum and copper up to 20 gauge.

Start by cutting the jaws and bending bar from closegrained hardwood. Attach a 1/8"-by-1"-by-18" length of strap steel to what will be the bending edge of the bending bar, using countersunk screws. Then countersink the holes in three pairs of 1"-by-3" full-surface hinges on the reverse sides of the leaves and apply the hinges to the bending bar and upper jaw as shown in the drawing. Connect the upper and lower jaws with a pair of 1"-by-3" loose-pin, full-mortise hinges placed at the extreme ends of the assembly. Finally, point the ends of a 28" length of 3/8" solid curtain or drill rod with a file, bend the rod to form a U-shaped handle and force-fit it into undersize holes in the bending bar.

To use the brake, grip the metal to be formed between the closed jaws, with the bend line flush with the top of the strap steel. Put a squeeze on the jaws with a bench vise at one end and a C-clamp at the other. Then lever the bending bar forward against the metal with the handle.— T. E. Halldorson, Evanston, Ill.

The Typing Table That Went to College

GLUED AND SCREWED TOP TO TOP ENDS AND 2"- 12 DIV DER F.H. WOOD SCREWS(4) LEGS, HELD BY SCREW. IN I" HOLE THROUGH PAO. HOLE 4 10 28 4 JOINING MOTCH FRONT WAS 18"2" 94 32 RUBBER PEAR RUNG CRUTCH TIP (4) SIDE RUNG (2) L'ALUMINUM TUBE 12" LONG SUP-ON TUBE 25/2" LONG S.DE-COTTET TEE (2)*115 BROOM CLIPS (4)

THIS typing table, born of necessity, has proved very popular in the rooming house where it has been used at the University of California's Riverside branch. Knocked down, it needs little space to travel along with its typewriter and student. It takes up only three cubic feet—and much of this can be filled by papers and books that have to go along anyhow.

Only a screwdriver and an Allen wrench are needed to assemble the table. The screwdriver is used to insert the screws pinning the legs in their sockets. The Allen wrench is needed to tighten the setscrews holding the rearrung. The shelf is secured by broom holders.

The desk can be made of either 1" lumber or 3/4" plywood. One-inch outside-diameter aluminum tubing is used for the frame, assembled with slip-on fittings.

The fittings come from the John H. Hosking Co., 1704 Howland Ave., Cincinnati, The four used cost about \$4.25.

—Paul Corey, Sonoma, Cal.

KNOCKED DOWN FOR TRAVEL, the legs and rungs of the desk fit into the top. The shelf, still loaded with books and papers, rides above, part of a three-cubic-foot package.

HOLD SHELF

Marbieizing Yule-Tree Lamps

For pleasingly different ornamental bulbs, fill a glass nearly to the top with water and add droplets of oil colors well-thinned with turps. As these float on the surface, stir them lightly with a tooth-pick until they form attractive marble designs. Dip uncolored 7½-watt lamps in the bath. Set them aside to dry in an upended paper box cut with holes or hang them on strings,—J. L. Monroe, Akron.

HERE'S an easy way to hang a temporary shower curtain at home or when you're away at a vacation cottage. My husband strung light clotheshine between suction cups stuck to the walls. Then we hung a large sheet of plastic from clothespins.—Mrs. William Koski, Racine, Wis.

CHRISTMAS-tree ornaments can be made shatterproof with shellac. Pour a little inside the ornament, swirl it around, and pour out the excess. When it's dry, replace the hanger clips. The film of hardened shellac will hold broken pieces together if the ornament is dropped.—
Edward Bentley, Jackson, Mich.

Windproofing Doors That Slam

INSIDE doors have an unhappy tendency to slam shut with a sudden breeze. This door holder solves the problem without causing you any extra effort to open or close the door. To release the catch, simply press its exposed end with the toe. Any light spring metal may be used to make the holder; the original was made of ½" tempered brass about 1/16" thick.—R. W. Bostrom, Minneapolis, Minn.

with padded seats until I priced regular upholstery and turned green. Then I hit on the idea of using old auto seats, bought at junk yards for about 75 cents apiece. I built them up on a hollow base so I even have storage space underneath.

—Clark A. Berkhoudt, Buffalo.

Patching **High-Voltage Leaks** in TV Sets

By Art Margolis

High water pressure in your plumbing lines can spring a leak. Sometimes the high-voltage system in your TV set acts the same way. The cure in both cases is to patch the leak. There is one big difference, however. A water leak is usually easy to locate. Tracing a high-voltuge leak takes electronic know-how

NE day when my wife was visiting friends in the next town her mother called me up at the shop. "My portable radio isn't working, dear;

could you pick it up?"

Fiddling absent-mindedly with the control knobs of a 21-incher I had been working on, I explained that I was busy Just then the audio came on, a sexy voice, "I'm waiting for you, darling."

"Busy, indeed!" came a snort over the

phone, then a click

I was about to call back when a group of girls trooped into the shop. They were on-the-job trainees from a local TV manufacturing plant on a field trip. The set on the bench was to be part of my demonstration. The symptoms were a hissing noise and streaking in the picture.

Explaining that the hissing was the sound of corona, I elaborated on the cause. "The high-voltage section of this particular set develops about 15,000 volts. The chassis is zero volts. The electrostatic potential between the two is powerful, and the 15 KV strives to go to zero

and equalize itself."

The girls nodded. I went on with my lecture. "Corona occurs when the potential gradient between conductors exceeds a certain value but is not enough to cause sparking. Air around the conductors breaks down electrically and is ionized. becoming itself a conductor. This makes the air glow blue."

"Can we watch it?" asked one girl. "Okay," I said. "Gather around while I switch the lights off " In the dark the bluish glow showed up plainly.

With the lights back on, I proceeded with an electrical plumbing job in front

of an attentive audience.

The path of the leak was from the cap of the 1B3 high-voltage rectifier tube to the top of the high-voltage cage. I removed the metal spring clip attached to the cap and put in a plastic-covered one. Then I took a sheet of plastic and taped it over the area that had been receiving the bombardment with high-voltage tape. I turned the set on. There was no hissing, and leaking voltage no longer streaked the picture.

To show that the blue corona haze was gone. I again turned out the lights. The girls crowded around me. A couple

of them giggled.

That was when the front door opened And there stood my wife's mother, the portable under her arm, an outraged look on her face.

A Bad TV Yoke Pays Off

DURING vacation last summer I found a leak in a laundry.

Ten couples from our Mr. and Mrs. Club had rented bungalows on a lake. At the end of the first week we had accumulated a small mountain of soiled clothes and linen. Three of us piled it into my station wagon and we drove off to the nearest town.

There was a self-service laundry on the main street. The owner didn't even look up from a game of solitaire as we walked in with our bundles. There were three machines, and we filled them all.

When I had my machine churning, I looked around. There was a 17-inch TV on a shelf. Since we'd be there an hour

or more, I asked the owner to turn it on.
"It don't work," he said, slapping a
black eight on a red nine.

"What's wrong?" I asked,

"You wouldn't know if I told you."

"Try me," I countered "It's got a bad yoke."

"You a TV repairman?" I asked.

"Nope, Plumber, But I'm taking a correspondence course in TV."

"Tried fixing it?"

"Nope. Got the lesson telling me what's wrong. Ain't got to the one telling me how to fix it."

"Mind if I look at it?"

"Nope."

When I turned it on, a picture came up. It was jumpy and tended to shrink.

I looked in the back. There was some sparking and spitting in the yoke.

The yoke around a picture-tube neck has two electromagnets: a horizontal winding that sweeps the picture from side to side; a vertical one sweeping it up and down. They are wound one on top of the other. There is a big voltage difference, since the horizontal winding contains high voltage, the vertical one low A heavy layer of insulation prevents leakage. Here I suspected voltage was leaking through a hole in the insulation.

I switched the set off. The man looked up from his cards. "Well, sporty, find the trouble?" I nodded. He swept up the deck and laid out another game. "Tell you what, sporty. Fix it and your

whole caboodle of wash is on the house."

I hesitated. I didn't have my tools, but decided to take a chance. I helped myself to some plumbing wrenches and dismantled the yoke. I found the hole. Then, remembering having seen a hobby shop down the street, I went out and came back with a piece of plastic. I slid it into the yoke, covering the hole.

With the yoke reassembled I turned the set on. I was in luck. The arcing hadn't as yet shorted any of the windings. A beautiful picture came on.

The solitaire player glanced up, then turned to see my buddies walking out, their arms piled high with clean, free laundry. The shock was too much for him. He missed a red jack on a black queen.

From an Author's Notebook

WE HAVE a "haunted" house on the outskirts of town. It had been vacant for years, so I was surprised to get a call from there one evening.

The guy said it was urgent. I don't usually go in for night jobs, but curiosity got the best of me. Before leaving I made an entry "Haunted House TV" in the little notebook I always carry to jot down material for these articles.

The man waiting for me on the sagging porch as I drove up was tall and lean, wearing faded khaki pants and a T-shirt. He led me into a room crammed with massive furniture under dust covers. Tattered shades hung askew over the windows. Cobwebs festooned every corner.

I pulled out my notebook and made some entries. "The TV is over there," he said, pointing to a 17-incher standing incongruously on the top of an ancient handcrank phonograph cabinet. "And the program I want to see is coming up."

"Let's look," I said, examining the set. No picture came on, but there was a loud snapping from the high-voltage cage.

While dismantling the TV, I explained about my spare-time writing. "Might be able to build up a mystery gimmick out of this setting."

"Say, that's an idea," he said. "Make me a criminal and this my hideout and . . "

"Wait a minute," I broke in. "Being an author isn't that easy. You've got to plot these things out."

He grinned. "You must come over and tell me about it some time. I plan to fix the place up and use it as a—well, sort of hideout."

He excused himself. I found the leak and went to work. There were flashes on the underside of the 1B3 high-voltage rectifier—from one pin to another. This leaking is different than corona, although the cause is the same. In this

case, with the short distance separating the pins, a complete path was ionized between the conductors, making the leak take the form of sparking

Pointy objects are more likely to spark over than round, smooth ones. Here I had to deal with the pointy pins on the tube socket. I spread the arcing pins away from each other. Then I sprayed some plastic on the underside of the socket. No more voltage leaking.

When I was finished, the man was at my elbow. I hadn't heard him come back. He looked at his watch, leaned over and changed channel. A program was just coming on. It was the first of a new filmed series by a world-famous mystery writer.

"And now," said the voice, "let me present our author."

I looked at the man who stepped into the picture. Then I did a double-take and gulped. The man on the TV screen and the man at my side were the same.

Truck Tool from Spring Leaf

A LEAF from an old car or truck spring is a versatile tool to keep behind a truck seat, and it takes little space. Cut the leaf to 36° and grind a bevel on one end. It makes a good lever for lifting the racks from a stake body, removing rocks from dual wheels, changing tires—in fact, for any job requiring leverage or prying force.—Robert K. Glatus, Onaway, Mich.

Template for Cabinet Hardware

Postrioning hardware uniformly on numerous kitchen cabinets and drawers can be done accurately and fast if you use a plywood template. Drill holes in a template representing a corner of the door or drawer and put pencil marks through the holes to show screw locations.—John Kelly, Cleveland.

Indoor-Outdoor Cane Tips

Anyone who depends on a cane will recognize the advantage of interchangeable tips—a rubber one for indoor use and a spike for slippery pavements. To make mine, I forced the male fitting from a shotgun-cleaning rod over the cane end. It takes but a moment to attach a mating fitting taped inside a crutch tip, or a similar coupling with a pointed steel pin attached to its lower end.—Herbert L. Phillips, Watertown, Mass.

Reclaiming Worn Torch Orifice

AFTER long use, the pencil-flame orifice in a propane torch becomes so enlarged it can't retain its small flame. To reclaim the tip, chuck it lightly in a vise and carefully tap the area around the opening with a ball-peen hammer. Try the orifice in the torch after each blow— F. W. Marasco, McKeesport, Pa.

Worn Stairway Risers Renewed

ARE the stairway risers in your home so badly worn by youngsters' flying toes and heels that they will no longer take a sanding? You can refinish them with linoleum floor covering having an imprinted wood grain. Cut panels to size and bond them to the risers with mastic.—R. M. Woodbury, Natick, Mass.

ROD DRILLED BEARING AND TAPPED THIS REPLACES THIS

Quieting a Bandsaw

On many bandsaws, a revolving disk is used to support the blade. However, the blade scrapes across the face of the disk and, if the disk stops revolving, wears a groove. You can make the saw run more quietly and save blade wear by replacing the disk assembly with a small ball bearing mounted on a length of rod. —F. Harry Louden, Sarasota, Fla.

A SECRET, simple lock keeps children out of my workbench drawer. It's just a bolt, dropped through a hole at the rear of the workbench top. The bolt enters the drawer and prevents it from opening. The bolt looks like it's there to hold the bench together but can be removed easily.

—David Hansen, Coronado, Cal.

Cord Quickly Dyed Any Shade

ORDINARY white string can be dyed with food colors for colorful modelwork or fancy gift wrapping. For extra-fast drying, dilute the colors in rubbing alcohol instead of water. The four standard colors can be mixed to provide any shade you want. The string can also be waterproofed by rubbing it with a wax candle.—James Kerry, Flint, Mich.

MINIMUM-SIZE LAYOUTS may fit into ready-made space in walk-in closets, or require wall removal. Note overhead clearance, as important as floor space.

Here are facts to help you come up with your own solution to-

Finding Space for That Extra Bathroom

By John L. Springer

IAN you fit another bathroom into your house? Probably yes, contractors say.

These experts maintain that a second or third bathroom can be squeezed into almost any house. Here are the facts and figures:

Bath fixtures fit into less space than most

people think. Into 25 square feet, you can squeeze a complete—if cramped—shower bathroom.

If you want a tub, you'll need a little more space. About the only concession you may need to make with these tight fits is to hang the door so it opens outward—into the hall or adjoining room.

Where will it go? Walk-in closets often can be turned into powder rooms or bathrooms without tearing down walls. If you have large rooms, stealing three feet from the length of one can make sufficient space. Sometimes a pantry can be spared.

A bathroom also can be put in a lowceiling area. You can tuck one into the attic under the eaves. Just allow 6'6" of head room for a shower; an even lower

ceiling is okay for a tub.

The layout. You can design your own bathroom to match your space. A washbasin measures 24" wide by 18" deep; a toilet 30" wide and 30" deep. Both fixtures should have a minimum clearance of 18" in front of them. Sometimes the same space will give access to both.

A small, stock shower stall measures 30" square; a small bathtub, 54" wide and 31" deep. Access to tub or shower can be through the same space in front of the

other fixtures.

A few fixtures are made that will help you cheat on these minimums. There are bathtubs only 42" wide, shower receptorbaths 39" by 39", and 4'-square diagonal tubs, some with a built-in seat.

Many small washbasins are available that protrude only 14" into the room,

Some small toilets are made, too.

But such shrunken fixtures can be hard to find, and they cost somewhat more than the standard models. Your best bet is to try the standard dimensions first.

Structural safety. Most houses are built with floor joists to carry a live load of 40 pounds per square foot. Ceramic tile with a mortar base weighs about 30 pounds per square foot, and some bathtubs weigh as much. It's obvious that a conventional bathroom will weigh more than an ordinary floor was designed to carry over a moderate span.

Good-quality two-by-eight fir joists 16" on center-common floor constructionshould not span more than 8' if they must support 60 pounds per square foot. Two-by-10 joists will carry the same load on a 13' span. You may have to reinforce

HOW TO SPACE THE FIXTURES: Plans show minimum desirable elegrances between fixtures, or fixtures and walls, regardless of layout.

Hiding a Key with a Knob

I DIDN'T like the looks of a plain key sticking out of the lock of an infrequently locked cabinet door. So I sweat-soldered the shank of the key into a slot hacksawed into a matching brass knob. The resulting combination looks like any other knob on the cabinet. When we want to lock the door, we merely turn and remove the key. It's hard to lose, too.—
Edward H. Schmidt, Baltimore.

Large Corks Made Smaller

A conx that's too large to fit in a bottle can be reduced to proper size by cutting a tapered slot in the side. The cork will squeeze closed as it is inserted —Daniel Bousha, Jackson, Mich.

the top off about 4" from the bottom, and use the resulting box as a disposable paint container.—B. S. Peary, Los Angeles, Cal.

the joists if you intend to use cast-iron fixtures and ceramic tile set in mortar.

The easiest way out, for a first-floor bathroom, is to cross the center of the floor joists with a supporting beam. The joists' weakest spot—the center—will rest on this beam. A four-by-10 beam almost surely will carry the added weight. Support it at its ends with four-by-four posts at least, or steel columns.

Strengthening second-floor joists takes more doing. Usual procedure is to remove the flooring and nail extra joists to existing ones. These must be supported at both ends by the bearing partitions. You probably won't have to double more than six joists to get sufficient strength.

An alternate method of reinforcing the floor—and incidentally providing space for pipes—is to build a platform floor above the present one. This means a step up to the bathroom floor.

If your building inspector okays it, you can avoid reinforcing the present floor by using lightweight materials. Tile set in adhesive instead of mortar, wall-board instead of tile, and enameled-steel instead of cast-iron fixtures will help save

weight, Basement bathrooms don't usually present structural problems.

The plumbing. Theoretically, you can put plumbing wherever you like. But when you add a bathroom, you must tie into existing pipes.

Try to add your bathroom under, over, or next to another bath, kitchen, or laundry room. The farther you go from existing plumbing, the higher the costs. And the closer you are to old plumbing, the easier it is to hide new pipes.

You may have to run the pipes in odd ways to avoid weakening your studs or joists. According to new minimum standards just adopted by the FHA, you can't notch wall studs more than one-fourth of their depth, or drill through their wide face more than 1½" in a 4" stud, or 2" in a 6" stud. Otherwise, you'd have to reinforce them by running a steel plate over the notched area.

You can notch joists in the top or bottom surface, but only in the end thirds of the span. The notch can't be more than a sixth of the depth of the joist except when it's made practically next to its support. You can bore holes up to 2" in

Non-Skid Stepladder Feet

Before using a stepladder indoors on a polished floor, staple pieces of innertube rubber over the feet. The rubber also will prevent alipping when the folded ladder is stored by leaning it against a wall.—Ken Mason, Grand Rapids.

Miniature Washers for Models

Tiny rings sliced off an old plastic ballpoint-pen cartridge make ideal washers for models. They compress enough to act as lock washers when tightened or can be oiled to serve as bearing washers.— Ben Morrison, Toledo, Ohio.

diameter to within 2" of the joist edge.

The practical effect of these rules is that you can run water pipes but not sewer pipes through joists. Waste pipes have to go under, over, or between the joists in floors and ceilings.

In a basement, there's just one place for the waste-disposal line—under the floor. The most practical way to tie into existing sewer lines is to chop up the concrete floor, lay the new line, then recement. The closer your bathroom is to the main stack and water lines, the easier the job will be—and the cheaper.

Most local codes specify sizes and types of pipe you must use to carry water to fixtures and take waste away. Sometimes the codes don't make much sense. For instance, New York City requires water pipes of galvanized iron. In the surrounding suburbs, local officials demand copper. Some places let you use \%" tubing to supply each fixture. Elsewhere the tubing must be \frac{1}{2}" or even \%".

A quick way to find out what probably applies in your town is to check the sizes of existing pipes.

Most codes also require that the waste

line for each fixture contain a trap—a U-shaped fitting to seal sewer gases out of the house. Behind each trap, there must also be a vent pipe running up to the roof and open to the air.

If indocless baths. Bathrooms deep inside the house are increasingly popular. They give you more freedom in locating a bath and, of course, no window means no drafts in tub or shower.

The advantages offered by windowless baths in location convenience and economy, plus recent developments in skylights and vent fans, have made them more than acceptable today.

Ventilation is automatic when you use an exhaust fan that turns on with the light switch. As long as you have such a fan, an interior bathroom will get the okay of most lending institutions.

Just observe these common regulations: Install a fan that will change the air completely every five minutes. (Figure the fan's rated capacity against the volume of the bathroom.) Provide incoming air for the bathroom by inserting a grille in the lower part of the door or wall, or by undercutting the door.

An Old-Timer's

Formula for Fine Wood Finishing By R. C. Stanley **TOOD** finishing as I practice it is always fascinating. Over the years I have developed a natural finish that brings out, in depth, all of the beautiful natural colors and shades of color in any dry wood. The finish also creates in the comparatively short time of two to 12 months a patina that equals natural aging for 100 years or more. I call it Wonderlux Wood Finish. Properly done, it lives up to the meaning of "wonder" and "lux." A potash solution is its base. Numerous employees have used the finish in my shop, but none knew the makeup of the solution, I have now decided to pass full knowledge of it on to others.

Patina forms quickly. All woods contain varying amounts of albumin. A natural patina comes from a film of albumin forming on the surface. It is believed that a photochemical action draws the albumin to the surface. The potash solution speeds up the process by combining with albumin and drawing it to the surface. It does this in

days or weeks instead of years.

The patina forms more rapidly on most softwoods than on hardwoods. When the patina film has formed, chemists can find no difference between it and the film created by 100 years or more of use and exposure to light. Result: the same coloring and mellowness of wood grown beautiful with age.

That, briefly, is patina. But I still don't understand, after all the years of using it, how and why the potash solution brings out the natural colors in wood. I know only that it happens.

In 1913 I established my own cabinet

R. C. STANLEY at work on a fine table in his shop in Canton, N. C. His experience in woodworking—and wood finishing—dates back to 1902. In recent years, tourists have carried his handswork bome to all of the states and several foreign countries.

282 POPULAR SCIENCE NOVEMBER 1959

shop. At first I copied the master craftsmen in all details except the fine hand carving, which I could not master. Sheraton and our own Colonial designs and construction suited me most. I combined what I thought was the best in design and construction in these, and came out with a style that has sold to tourists from all of the states and several foreign countries. My natural wood finish solved the main problem of decoration.

Hand carvings and moldings were easily and profitably eliminated by the artistic use of figured-wood overlays. Used as overlays, crotch woods in mahogany, walnut, cherry, mulberry, apple, white pine—indeed, almost any wood—are all superior to carving in my eyes. The overlay exposes all of the figure and natural colors of the wood.

Beauty in a pine knot. You might saw a white-pine knot lengthwise through its center, then take a piece a quarter-inch or so thick from each half and fit the edges together to form an overlay. After the finish is applied, the pine knot shows natural fiery reds and other colors of medium and high brilliance, feathering out into many delicate shades of color.

Traditionally, wood has been used with a preconceived idea of covering it up with stains, paints, and most anything that will hide it. Home builders hire expensive decorators to tell them which colors Experience is the best teacher—in wood finishing as in other endeavors. A half-century of experience lies behind this article

and combinations of colors, in paints, varnish stains, and what not, will most effectively hide one of the most beautiful natural creations: wood.

My Wonderlux is about the least expensive finish I know of. It does require time and elbow grease. But consider what you get in return—a natural-wood color that blends perfectly with any color in rugs, carpets, upholstery, drapes or lino-leum. No need of a decorator there.

Any previous finish must be removed, preferably by scraping lightly. Parts that are difficult to scrape may be cleaned with varnish remover and a stiff bristle brush, followed by garnet paper or coarse steel wool, or both.

it's a three-step finish. Wonderlux finish requires three separate operations with three materials.

The first material to be applied to the wood is a mild solution of potash in water. Crude potash, obtained by leaching wood ashes, is preferred. But since

Mr. Stanley's Finishing Formula in Brief

STEP 1. Rub in a mild solution of potash after the wood has been prepared by sanding it smooth. Give hardwoods a second application after the first is thoroughly dry. Rub down the surface with a dry cotton rag on frequent occasions for several weeks. This step gives the wood surface a patina.

STEP 2. Make a mixture of equal parts of clear spar varnish, kettle-boiled linseed oil, and turpentine. After sanding the surface lightly to remove the raised grain, rub in this mixture thoroughly with a lint-free cotton cloth. Squeeze out the cloth and rub the wood surface vigorously until it looks dry.

57EP 3. Give the piece two or three waxings several weeks apart with a good paste floor wax, rubbing each one down well before applying the next. Thereafter liquid wax can be used if desired.

wood ashes are not always obtainable, a mild solution of a purified potash known as "pearlash" can be used. A "mild solution" is one that feels slick, like soap, between the thumb and finger.

Pearlash is a white solid obtained at drug stores. It is gradually added to the water and dissolved until it becomes slick No specific strength is required, but one ounce of pearlash to a gallon is a good solution in soft water; hard water requires a bit more. For the hard, close-grained woods, the solution should be somewhat stronger than for soft, more porous wood. (Do not put the solution in a plastic or aluminum container.)

The potash solution may be applied

with a paintbrush. I prefer to wear rubber gloves (it discolors the fingernails otherwise) and rub the solution into the wood with a cotton rag. The aim is a uniform saturation of the wood surface with as much penetration as possible. The solution will cause only slight discoloration of the wood surface. Hardwoods should be given a second application after the first is thoroughly dry, and allowed to dry from four to 10 days.

Since wetting the wood surface will have raised the grain, you will need to remove the fuzz. Do this with 0000 garnet finishing paper or fine steel wool.

Wood treated only with the potash so-

Ж Гей, Русские! Вот Наше Решение Вашей Задачи

*Hey, Russians! Here's Our Solution to Your Puzzle

THE hen tracks above are a reproduction of an interesting mechanical puzzle that recently appeared in a Russian magazine, Young Technician.

Two identical bolts (it says there) are placed in contact as shown. Suppose you begin to rotate one bolt around the other, holding their heads in such a way that neither can turn upon its own axis. Then: (a) the bolt heads approach each other, or (b) they draw apart, or (c) the distance between them remains un-

changed. Which is it? The puzzle is to be solved without experimentation,

The answer appears on page 213 as it was given in the Russian magazine. But even if you can read it, you may find it disappointing. It tells what happens but fails to show why.

After you've decided on your own answer and the reason for it, turn to the translation of the Russian solution and PS's own (and we think better) explanation, also on page 213.

Counter-Top Cabinet for Silver and Cutlery

THREE or four plastic silver trays and plywood or lumber acraps are all it takes to make this countertop cabinet for silver or cutlery. Cut dadoes in the sides, or attach cleats of thin plywood, to make drawer guides for the trays. The case may be painted to match or contrast with the plastic trays or the kitchen cabinets.—James A. Lockhart, Bryan, Ohio.

BELUE containers without caps can be sealed easily and effectively by placing a small piece of heavy paper over the hole. This keeps out air, and is easy to remove.—Frank H. Kelly, M.D., Argos, Ind.

Hanging Shoes in the Closet

If you need an extra rack to hold shoes and slippers, screw a row of wire coat hooks along the closet baseboard. Each hook will hold a shoe off the floor.—
Robert Woods, Athol, Mass.

AFTER applying the finishing coat to a freshly laid sidewalk, we troweled tree leaves into the wet surface along the edges. When the cement set, we washed away the leaves with a garden hose. They left an attractive patterned border, as permanent as the walk itself.—Verda Ross, San Bernardino, Cal.

Adapt Vise for Tapered Work

An attachment that clamps over one jaw of my vise makes it possible to grip tapered pieces. One of its two parts is a half-round block cut from a short length of round bar stock. It is drilled through the center to take a pivot pin—a cold rivet works fine.

The other part, made from sheet steel or brass, fits around the outside of the vise jaw and is connected to the half-round piece through the pivot pin. By pivoting, the half-round piece adjusts itself to hold any tapered work.—William E. Duggan, Fairfield, Conn.

Short Cuts

Identifying Side of LP Disc in Dark

To mentify the first side of an and record, even in poor that I stick a gummed loose-leaf hole-reinforcement ring on the label. The rings can also be put on the favorite sides of popular records.—Joseph S. May, Brooklyn, N.Y.

Gluing Miters with Cigar Boxes

MITTERED joints in light stock may be held together for gluing by clamping them to coverless eigar boxes. If the stock is light enough, a single box can serve four corners if it is cut into sections.—

G. E. Hendrickson, Argyle, Wis.

Bolt-Cutting Made Easier

A JIG made from a half-hinge will simplify and speed up cutting a number of bolts or rivets to uniform length. Clamp it in a vise and saw a slot at the point where you wish to cut the bolts or rivets.

—Bit Tolman, Palatine, lil.

More Calking from the Gun

Some calking-gun plungers can't be ratcheted far enough forward to force the last bit of compound from the cylinder. Two or three extra notches hacksawed and filed in the rear of the push rod fix this.—Ray Mocre, if ellswille, Ohio.

SCIENT TEMPORE NEW PRINTERS AND PRINTERS AND

ANOTHER FRESH ONE FROM PONTIAC REVS UP A NEW KIND OF EXCITEMENT FOR 1960

Here, without question, is the most provocative package of road machinery ever to bear the respected name of Pontiac.

Coming and going, the 1960 Pontiac exhibits a clean, classic look that has even the most avid customizers nodding their approval. Here is total artistry in automotive design, shaved and sharp.

For unmatched action, tap the resources of the Tempest 425 with Tri-Power! This fiery, famous power plant is one of a wide range of power packages available in the 1960 Pontiac. Every one is a finely honed

version of the respected 389 cubic inch Tempest and one (the 425E) performs on regular gas.

Tie this Tempest-tended performance to Pontiac's Wide-Track Wheels ... and you've got the most exciting and road-wise passenger car you've ever hustled or handled.

See your Pontiac dealer soon. Rev up a Fresh-Point-of-View Pontiac and put it through its paces. You'll heartily endorse it as the most satisfying production passenger car of 1960.

EASTMAN KODAK COMPANY

New Kodak team shoots and shows superb hobby pictures <u>automatically!</u>

THE CAMERA: New Kodak Automatic 35 with electric eye automatically sets the correct exposure!

THE PROJECTOR: The New Kodak Cavalcade changes slides automatically while you enjoy the show!

Wherever you are . . . whatever your subject . . . here's a team matched for the most satisfying hobby pictures ever. It lets you shoot and show them automatically!

Picture-perfect exposures. The Kodak Automatic 35 Camera frees you from exposure calculations—so you can concentrate on your subject. You can move from sunlight to shade, shoot indoors with room light or photofloods, yet never make a lens setting. The electric eye does that for you. It adjusts the lens to the light. It even signals you when to use flash. And all automatically, whether you are taking snapshots or color slides.

You can get extra-closeups. Shoot small subjects and hobby projects as near as 2½ feet! Finder allows for parallax.

You load fast. No threading. One thumb flick winds the film. And the fast //2.8 lens means speed to spare, even in dim light.

Perfect picture shows. The new Kodak Cavalcade Projector, Model 520, changes up to 40 slides in succession—automatically! You set it just once for 4-, 8- or 16-second change intervals. Turn it on, and it does the rest. You never have to lift a finger.

Your slides stay in focus from first to last because they're preconditioned by warm air. They're kept safe, too—each held in its own steel protector.

You can point out details on the screen with the shadow arrow. Edit as you show. Lift out any slide as you go. For a second look at alides already shown, or to skip ahead, just touch the control wheel.

And all the time, you and your guests enjoy beautiful slides shown at 500-watt brilliance automatically!

See this great automatic pair demonstrated at your Kodak dealer's. The Kodak Automatic 35 Camera is only \$84.50, or as little as \$8.50 down at many dealers'. The Cavalcade 520, only \$124.50, or as little as \$12.50 down. Hitch this team to your hobby. You're sure to enjoy it even more!

RESULTS EVERY TIME

Bright-frame finder shows framing allowance for 3 and 5 feet.

You focus as near as 2½ feet. Or even closer with Kodak Portra lenses.

(List prices, including Federal Tax, and subject to change without notice.)

Handy Desk for Lathe Users

This lathe desk is useful for keeping tool holders and wrenches in order, side by side with sketches and instruction sheets. It was made by routing recesses for each tool in a board. But jigsawed openings in a board fastened to a solid back would do as well. Legs of strap iron support the desk; a spring clip holds drawings.—Hugh Lineback, Stillwater, Okla.

►►► A PAPER match, soaked below its head with a drop or two of lubricating oil, supplies a good substitute for layout dye. Burn the match under the piece to be scribed; soot and condensation make a black, sticky deposit that can be easily rubbed over the work. Scribed lines and prick punch marks in the blackened surface are accurate and easy to see.—Carl L. Beddig, Oakland, Cal.

PPSURFACE finishes of highly polished metals, such as stainless steel or aluminum, must be protected during bending or forming operations. One of the best, and least expensive, methods is to paste a sheet of heavy kraft paper on the cleaned metal surface. After forming, remove the paper by soaking in hot water. Wallpaper paste is a good adhesive for this job.—Federico Strasser, Santiago, Chile.

Yardstick with an Angle

HOLDING a yardstick by one hand on the edge of a board can be simplified by attaching a second, and reversed, yardstick as shown. The angled stick may be slid easily along a board, with the double numerals permitting easy reading from either end.—R. S. Henderson, Beloit, Wis.

Pad for Soldering Small Parts

TIGHTLY rolled asbestos tape, held with a large hose or duct clamp, makes a good pad for soldering or brazing. In addition to protecting the bench top, the pad helps hold the work. Nails, bent at right angles, can be pushed into the pad to hold parts.—H. J. Gerber, Stillwater, Okla.

Electric Starter for Stubborn Scooter

When I had trouble starting my mail-carrying scooter during my daily sixhour trip, I decided to equip it with an electric starter. I used an old auto-starting motor, and belted it to the clutch. I have a sidecar for the mail and found space in it to hold the battery. The whole rig cost me only \$20, including the battery.

—Raymon H. Gough, Genera, Neb.

PDDA SMOOTH bend can be made in electrical conduit with a length of BX cable. Insert the cable in the conduit, then bend the tubing around a utility pole or other sturdy post. The BX keeps the conduit from collapsing, but is easy to remove after the bend is completed.—Carl A. Kleppe, Milwaukee, Wil.

Pocketing a Long Screwdriver

CARRYING a long screwdriver in a short rule pocket can be made easier by attaching a stout safety pin above the pocket. The loop of the pin supports the tool.—G. H. Ellender, Lansing, Mich.

PUNCH MADE FROM DRILL ROD HARDENED AMD DRAWN LENGTHS ALWAYS AT 80° ANGLE TO AR SLIP PIT PRIN PREVENTS SCREW FROM TURNING

Spinner Hurries Jackscrew

THE hand wheel of the jackscrew on the hay baler took two hands to operate and worked slowly. So Armin Garver of Boardman, Ohio, installed a ball-bearing steering-wheel spinner on it. Now he can raise or lower the jackscrew quickly, with one hand.

—John Krill, North Lima, Ohio.

Layout Tool for Right Angles

This device uses fundamental geometric principles to lay out right angles or perpendiculars without fuss. Layout is more accurate than with dividers, and it can be used where a square won't work. In using the tool to erect a perpendicular to line AB from a punch mark at C, the point of the pin in the short link is placed in the punch mark at C. Placing one of the other pins anywhere on AB automatically sets the third pin on a line perpendicular to AB. A line drawn between marks at C and D will be perpendicular to line AB. The distance from C to E is immaterial.—F. Murray, Chicago.

вез помощи энсперимента

Расстояние между голознами болтов останется ненаменным. Взаимное дакжение болтов в данном случае межно сравнять с движением человена, моторый поднимеется по всивлетору с такой же скоростью, с какой лента эскалатора движется вина.

Here's the RUSSIAN Answer to That Bolt Puzzle

ABOVE is the Russian solution to the bolt puzzle (see page 204). The translation: The distance between the bolt heads remains unchanged. The action of the bolts in the given case may be compared to the movement of a man who runs up an escalator at the same speed at which the tread is moving down.

But PS Would Put It This Way

THE escalator analogy ignores the key to the problem, which is that a clockwise movement of bolt A around B involves an equal but opposite, or counterclockwise, movement of B around A. Try it with your two forefingers.

Therefore, while A is traveling up the threads of B toward head b, bolt B is simultaneously moving down the threads on A, away from head a. As the thread pitches are identical, the heads remain a constant distance apart. Even if the motion of A around B be reversed, the action of the two threads would simply be interchanged. They would still cancel out.

Bleacher Shelves for Crowded Cupboards

THESE tiered shelves expose each item to instant view and easy reach in a crowded cupboard. The sides were cut from 1" stock, the tops from ½" material, and the risers from ½" hardboard. The overall depth should be about 3½" less than the shelf to leave room for larger packages.

Notches were cut to make room for shelf brackets. Dimensions are variable; those

I used are given only as a guide.—Thomas II illiams, Springfield, Ill.

Flexible Coupling Made from Tire

This flexible coupling has been in use on my arc welder for six months and shows no sign of wear or deterioration. It's an old airplane tail-wheel tire with one side clamped to the engine flywheel, the other to the generator. The parts required welding and turning on a lathe; I split the flange rings to facilitate putting them inside the tire casing.—Gene W. Taylor, Wolf Creek, Mont.

Deep-Dish Rack for Paint Roller

UNLIKE the usual shallow paint-roller tray, this one is easy to carry and hard to spill. The vertical rack is a 10"-square piece of expanded metal brazed to inch-wide strap iron, cut to fit a five-gallon bucket. The strap is bent over the bucket run, then drilled and tapped to accommodate thumb-screws. The rig holds a lot of paint for big jobs.—Jay N. Corner, Ukiah, Cal.

Hints from the Model Garage

Protect your hands from contact with chilled metal by slipping a length of heater hose over the shank of your lug wrench. The hose will also keep the wrench from marring rims or whitewalls when prying off wheel covers.

Frayed door piping can be improved in appearance, or the piping in a new car protected, by covering it with flexible clear-plastic tubing. Slit the tubing along one side and force it over the piping. Tuck the ends under the metal step plates.

Fool old man winter by placing several synthetic sponges and a plastic bag inside the windshield-washer bottle. Fill the bag with water and solvent. If the solution should freeze, the sponges and bag will allow for expansion.

Racing cars 9 out of 10 winners . . . both "big car" and stock car, over the past 5 years, used Champions-

Car makers—over twice as many makes (includir Rolls Royce) specify Champions- 16 in all!

Aircraft-more aircraft (including over 90% of all airlines) use Champions than any other plug-

Trucks-17 out of 21 U.S. makers specify Champio spark plugs for full power, regardless of load or road.

Q. Why is it that wherever performance is vital - on land, sea or in the air—the experts choose Champion spark plugs?

farine engines—9 out of 10 power boat winners on U. S. outboard engine makers—use Champions.

Fire engines - all major makers use Champions for sure starts and complete dependability.

olice oars—nearly twice as many U.S. police cars to powered by Champsons as by any other plug.

Farm tractors—every major U.S. maker specifies. Champions for the dependable power farmers need.

A. The experts know from experience that you can always depend on Champions. To get top performance from your car, put in a new set of Champions every 10,000 miles!

More Lints from the Model Garage

Tether a purse, briefcase or deliveryman's route book to a small sponge-rubber ball, and it won't slide off the seat. Tuck the ball between seat cushion and backrest to anchor it. The ball can be dropped into the purse or briefcase when not in use.

Roads salted in winter? This under-car spray rig will flush away salt deposits as you slowly drive the car into the garage. Place the rig across the driveway and connect it to the garden hose. Drain the hose after using so it doesn't freeze.

Light scratches on a windshield can be polished out without affecting visibility, but removal of a deep scratch might cause distortion in the glass. If the deep scratch is in the line of vision, it had best be left alone or the glass replaced. To

remove light scratches, proceed as above. A polishing kit—part No. 987,502—can be obtained from Pontiac parts dealers. It contains an abrasive called Glass-Nu and a felt wheel for applying the compound and buffing out scratches.

SHOULD KNOW ABOUT GASOLINE ADDITIVES

Your fuel system has been precision-designed and engineered to help your engine deliver maximum performance and economy. And gasoline tank additives can help you maintain these desired results, no matter what make of car or truck you drive.

Normal driving causes deposits of carbon, gum and sludge to accumulate in your fuel system. Even when the system is in perfect adjustment, these deposits will cut down on your per-

formance and economy. And, unless these deposits are removed, it is impossible to effectively adjust or time your engine.

The proper gasoline additive will clean your fuel system and keep your performance alive. And regular use of an additive will belp provide you with consistently good performance.

Since many additives leave deposits of their own, and others do only a partial job, the world's largest manufacturer of original equipment earburetors has researched and tested a new additive, CARBON-X 77.

BY THE MAKERS OF AMERICA'S NUMBER ONE ORIGINAL EQUIPMENT CARBURETORS

CARBON-X 77 in the complete fuel system conditioner. It dissipates the formation of natural gums in gasoline, allowing the fuel to pass through carburetion and combustion without forming gum deposits in the tank, lines, fuel pump or carburetor.

It resists the formation of coke and carbon in the intake manifold and combustion chamber, and protects the entire system from acidic corrosion. And CARBON-X 77 keeps gas lines free from ice formation and eliminates carburetor icing.

Next time you get gas, ask for CARBON-X 77. You'll notice the difference on your first trial can. CARBON-X 77 is recommended by the makers of America's number one original equipment carburetors. Rochester Products Division of General Motors, Rochester, New York.

If automotive service is your business, ask your nearby UMS distributer about CARBON-X 77, the complete fuel system conditioner, plus the rest of the fast-moving Rochester-GM Carburstor Service Line . . . Carb-Alkater, the CARBON-X chemical line and factory-recommended carburster replacement units and lits.

America's number one original equipment carburetors

URETORS

ROCHESTER

Today's close tolerances

For the finest protection money can buy...

leave no tolerance for dirt!

That's why AC has developed the new Triple-Trapper principle of filtration — protecting critical engine areas where lubrication must not fail!

The job of an oil filter is to remove every contaminant or foreign substance such as dirt, grit, metallic bits and carbon so they won't wear away or scar finely finished surfaces. Finely drilled oil passages must not be clogged by any impurity. For example:

In many engines you will find an hydraulic valve lifter between the camshaft and the push rod that actuates the rocker arm and valves. This key component keeps "play"

or looseness out of the valve train and thus makes for quiet, efficient, split-second valving. The lifter has needle-fine valving itself which admits the oil so necessary for hydraulic operation. A tiny bit of metal or dirt could clog the opening and give you trouble. As long as an AC Triple-Trapper Oil Filter is on the job—and is changed regularly—such troubles are practically eliminated. AC conducts 96 reliability tests on its oil filters during manufacture to insure highest quality!

TRAP NO. I is the filtering element itself, a resin-impregnated meterial that traps particles as small as 1/15 the diameter of a human hair

TRAP NO. 2 is the emount of filtering area. The AC filter has more usable area. . or surface. Oil, passing through the filter, is spread out and slowed down over this greater area. Thus, the filter has a chance to catch

fine particles. The trapped particles themselves form a filter "bed" on top of the filter element. This below trap even finer particles.

TRAP NO. 3 is the design of the filter element, a unique arrangement of folds that provides maximum filtering area, hence maximum filtering capacity. Because of this greater capacity, the filter is able to hold more particles.

TRIPLE-TRAPPER Oil Filter used on more new cars than any other brand

Gus Pulls a Switch

By Martin Bunn

TITH a bowl of beef stew, apple pie a la mode, and two cups of coffee under his belt, Gus Wilson walked leisurely back to the Model Garage. His young assistant, Stan Hicks, was sitting at the workbench dropping banana peels into his empty lunch box.

"You got a one-track mind, Gua?" Stan asked, taking half a banana in one bite.

"On that, Stan, I plead the Fifth

Amendment, But why?"

"Howie Stone, He stopped by to cry on my shoulder about all auto mechanics having one-track minds."

Gus leaned over and adjusted a wrench hanging askew on the tool board. "So that used station wagon of his is still acting up. Were you able to fix it?"

"I didn't even get a chance to look at it," Stan said, "When I told him that the symptoms he described sounded like a faulty fuel pump he blew his top and drove off. And the way his car sputtered and balked, it sure sounded as if it was starved for gas."

"Howie's a nice boy." Gus said, "but stubborn, like all the Stones. Guess he just made up his mind it's not the fuel

pump, and that's that,"

"Wish we could help him," Stan said. "He spent all his money on that wagon, got his package-delivery service started-and now he can't deliver."

Gus nodded. "I know. P. J. Bassett told me about it over at the diner."

"You mean Howie's going to lose the job of hauling Pete Bassett's express shipments to the railroad station?"

"Looks like he's lost it," Gus said. "He missed two trains last week. And Pete's maple-sugar candy got off to the customers a day late."

The telephone rang in the Model Garage office. Gus answered it, did more listening than talking, and came back into the shop. "That was Pete Bassett. He's staying late making up a big order that must make the evening train."

"Gosh, Gus, and Howie probably won't

be able to make it,"

"Pete didn't want Howie. He wants me to come over and get his old pickup running. He hopes to use it to start making his own deliveries again until he can get a new truck."

"Maybe we could stall," Stan suggested. "Maybe we can somehow get Howie to bring his wagon in here and let you check it over."

Gus grinned broadly. "Maybe we can, Stan, maybe we can-if you're willing to aid and abet."

Stan looked at his boss eagerly, "Skulduggery?"

"Not quite that bad, but maybe a few white lies."

"Count me in," Stan said, "What do I do first?"

"Check the bins and make out a list of stock parts we need while I make a phone call."

Stan looked puzzled, shrugged his shoulders and went to work.

HALF an hour later Stan walked back into the office and handed Gus an order list and carbon.

"Want me to run over to Milltown for

these? Nice day for a drive."

"Sorry to disappoint you, Stan, but I've just put in a call for your pal Howie Stone."

"Oh, no. Gus. With his wagon running the way it is, Howie'll never make those hills on the 10 miles to Milltown and back."

An engine sputtered to a stop outside. "Here's Howie now." Gus gave his assistant a shove. "Get back in there and keep out of sight."

Stan pulled his cap lower over his eyes. "The plot thickens," he said, slinking dramatically off toward the rear of the

garage.

UTSIDE Gus greeted Howie with an innocent smile. "Glad you got my message about that pickup in Milltown. It's a rush job."

Howie's smile wasn't as cheerful, "Gee, Mr. Wilson. I'm afraid I'll have to

turn you down,"

"You're in the packagedelivery business, aren't

you?"

"Well, I thought I was until this station wagon of mine started acting up. I can limp around town okay, but once I get on a hill !"

"What seems to be wrong?" Gus asked.

"I don't know-yet. I've wanted to ask your help, Mr. Wilson, but after I refused your offer to check the bus before I bought it —well, I've been sort of embarrassed."

"But you've seen other mechanics?"

Howie nodded, keeping his eyes down, and shuffling his feet. "That's right-and they all seem to have one-track minds. Fuel pump, fuel pump, fuel pump—that's all I hear. Why, one fellow even wanted to charge me 100 bucks to tear down the engine—just to put in a new fuel pump."

"Maybe it is your fuel pump," Gus

said.

"Shucks, no, Mr. Wilson. I put a new one in myself, and it didn't make a bit of difference."

Gus held out the parts list. "Looks like we're both in a jam, Howie. I need these parts bad."

"I'd like to help, but . . . "

"Let's help each other," Gus broke in. "You take my truck and drive over to Militown and pick up these parts. I'll phone Ace Supplies so they'll have them ready. And while you're gone I'll have a look at your station wagon."

Howie looked up, a grateful-puppy expression in his eyes. "Swell, Mr. Wilson," He took the list Gus handed him and climbed into the Model Garage truck.

"But you can forget about the fuel pump. Nothing wrong with it." He stepped on the starter and drove off.

Where'd it come from?

A BAKER'S DOZEN: Not 12 of anything, but In the 17th century. "Merrie England" was pining under the Puritan austerity of Oliver Cromwell. Bakers were ordered to bake smaller rolls to conserve flour. Housewives objected so strenuously that bakers sitpped in an extra one "for good measure"

HEN Stan Hicks came out of hiding. he found Gus with his head under the station-wagon hood. "Hi, boss, have you forgotten Pete Bassett is expecting you?"

Gus straightened up, "No, Stan. And if he phones, tell him I'm out on an emergency. Now start this wagon and we'll see how she sounds."

As the engine started and settled into a smooth idle, the office telephone rang. And from then on it continued to ring every five minutes with Stan running back and forth to answer it.

Working on the engine, Gus moved the throttle linkage. It raced briefly, then began to sputter. Just before stall, he let it settle back to idle and

asked Stan to turn the wipers on. Each time Gus gunned the engine, the wipers

nearly stopped.

"Cut it," Gus called. Stan did, and ran to answer an insistent telephone ring.

Gus was at work on the engine innards

when his assistant reported back.

"That was Bassett again. His help's left for the day. He's alone at the plant with a no-go truck, a big ready-to-go order, and that midget sports car of his that hasn't room for an extra package of chewing gum. And he's mad at you."

"I was hoping for something like that," came the muffled voice of Gus as he backed off the last fuel-pump mounting bolt.

Good advice to Car Owners ...

Casite's 3-Zone Engine Protection

adds new power and performance!

Now three new Casite products reduce friction, keep your car's engine and automatic transmission clean and at peak operating efficiency.

Developed by the technical staffs of Casite and its parent organization, Hastings Manufacturing Company, these products are the results of years of specialized research in the field of automotive maintenance.

You probably are aware of the damaging effects of modern stop-and-start driving on high compression engines and automatic transmissions. In our own engine testing laboratories, we've seen how acids, rust and corrosion—from condensation caused by fluctuating extremes in operating temperatures—cause poor performance and deterioration of engine parts.

Utilizing the latest proved chemical discoveries, Casite technicians have developed and perfected scientific correction and protection for the three vital areas of car performance—the firing zone, the friction zone, the transmission zone. Each requires specific treatment to keep your car's "power plant" clean, at top operating efficiency, with minimum friction.

The three Casite products perform these specific functions. Each is a liquid concentrate additive—for gasoline, for crankcase oil, for transmission fluid.

You can use them without mechanical labor costs or expensive parts dismantling or replace-

This is the Improved Casite Tune-Up, for the firing zone. It's the nation's favorite "tune-up in a can," now greatly improved with spark plug and carburetor cleaner and acid inhibitor.

It is recommended for use in the gas tank or carburetor air intake to free valves and rings, and clean carburetor and spark plugs.

Also, for use in the crankcase oil for quicker starting, less start-up wear, and to break in new or rebuilt engines. The price is only \$1.25.

For a quiet smooth engine, you'll want Casite 3-C, with Barimen. This is a new heavy duty crankcase concentrate developed for the

friction zone. Added to motor oil, it gives you a tougher oil that won't thin out—oil that cushions the load on every working part, cuts friction and wear, reduces oil consumption, too! Casite 3-C stops hydraulic lifter noises, quiets and smooths the engine. Cleans the engine, and keeps it clean—protects against acid, rust and corrosion. Costs only \$1.50.

Casite "Smooth-Seal" is the latest scientific development for automatic transmissions. It reduces jerks and roughness, assures smooth, quiet operation.

It stops and prevents leaks due to hardening or shrinking of transmission seals. Also reduces shock and wear, enables parts to last longer. Only \$1.95.

Most service stations have a supply of Casite products to protect your engine—or can get them in a hurry.

Just ask for Casite Tune-Up, 3-C and "Smooth-Seal," Use them with confidence. If you're not entirely satisfied with the results, let us

know. We'll promptly send you double-your-money-back. That's how strongly we feel (and millions of car owners do, too) that Casite products will solve many of your engine problems, reduce repair bills—and keep your car rolling for many thousands of carefree extra miles!

HASTINGS MANUFACTURING CO. - HASTINGS, MICH.

Casite, Piston Rings, Oil Filters, Spark Plugs

When Howie Stone drove up in the Model Garage truck, Gus had just returned from a test run in the station wagon. He was putting the engine through its paces. It accelerated smoothly, ran like a top.

Bug-eyed, Howie jumped out, "What

was wrong?"

"Never mind that now," Gus said.

"It's running—and I suggest that you get right over to Pete Bassett's plant."

"Huh? Mr. Bassett wants nothing to do with me. He made that plain enough after I missed the train the other day"

"I think he'll be glad to see you now, though," Gus said, sliding out from behind the wheel of the station wagon.

"Now get in, boy, and get going—but don't tell Pete you've even seen me."

As Howie pulled away, Stan cocked his head and looked at his boss. "Talk about a mother hen and her chicks. But wait till he hears about that fuel pump." The phone rang. "What'll I tell Pete?"

"Tell him if his shipment misses that

train it serves him right . . . "

"For trusting an old fraud like Gus Wilson," finished Stan laughing

LATER that evening there were lights on in the Model Garage. Gus was doing some work on his own car when Howie Stone walked in. There was a broad grin on his face.

"You were right, Mr. Wilson," he said.
"Pete Bassett was glad to see me. And

you know what?"

"No, what?" said Gus, pulling a pipe

from his coveralls pocket and filling it.

"He had an order all ready for me to deliver. Said if I made the train he'd sign a contract with me for all his deliveries. I made the train."

"That's fine, Howie. Now, I've got a pot of coffee brewing in the office. How

about joining me?"

"Sure, thanks. I did want to ask you

what was wrong with my car."

When they had taken their first sips from steaming mugs, Gus broke the news. "The fuel pump wasn't operating."

Howie put his mug down with a jolt that splashed coffee over papers on Gus's littered desk. "But it was a new pump. I put it in myself," he protested.

> "I didn't say the pump was bad, but that it wasn't operating. It's like this:

"Combination vacuum-booster fuel pumps have a stronger diaphragm spring than the single-purpose types. Once in a while the extra pressure causes the cam to wear. The more it wears, the rounder it gets. Eventually there's hardly enough lift to keep the pump supplying fuel for a slow idle."

As Howie nodded in understanding, Gus went on. "When you race the engine, the carburetor bowl empties faster than the feeble pump

stroke can fill it."

"But why should a job like that cost \$100?" Howie asked.

"Well, to fix it means removing the radiator, cylinder heads and all the valves in order to replace the camshaft."

"And you did all that while I drove to Milltown and back," Howie said in admiration. "Well, with the Bassett business I guess I can afford it."

"Your bill is \$14 for an electric fuel pump," Gus said. "My time is free in exchange for picking up those parts for me."

Howie pondered that one for a minute. Then: "I get it. An electric fuel pump doesn't need the camshaft to operate it. It's self powered. You switched pumps."

"Right," Gus said. "Mechanics may have one-track minds, Howie, but we know a good switch when we see one."

Next Month: Gus keeps Santa on schedule.

here for the first time anywhereelegance with economy

SUPERLATIVE 60 CHEVROLET

Here's new gem-bright beauty, new room to sprawl in and sit tall in. New lean-muscled engine economy, new spirit and silence in its going. For fineness of features, for precise craftsmanship—for all the things that make a car good to own—the '60 Chevrolet stands alone in its price field.

Just wait till you see it. Everything about the '60 Chevy, every styling accent, every engineering detail, has been polished and refined to a degree of perfection never before thought possible of a car in Chevrolet's price class.

Picture practicality and economy combined with the luxury and hushed comfort usually associated with high-priced cars. That's Chevy! You have to see it up close to appreciate its fine

workmanship. You have to take a turn behind the wheel to know its astonishing smoothness and almost total absence of road hum and vibration. We'll admit our enthusiasm's showing just a bit — but once you've dropped into your dealer's we're sure yours will be, too. There's nothing like a new car—and there's never been a new car like this '60 Chevrolet! . . . Chevrolet Division of General Motors, Detroit 2, Michigan

NEAREST TO PERFECTION A LOW-PRICED CAR EVER CAME!

COLVAIN BY CHEVROLET WITH THE ENGINE IN THE REAR WHERE IT DELONGS IN A COMPACT CAR! * * *

America's only car with an airplane-type horizontal engine! America's only car with independent suspension at all 4 wheels! America's only car with an air-cooled aluminum engine!

The rumors about this one were right—but they didn't go far enough. Because here, for the first time, is a truly compact, economical U.S. car that retains the ride and 6-passenger comfort you're used to in a big one. The key to this small miracle: America's first and only rear-mounted aluminum engine—a revolutionary 6-cylinder power plant that combines compactly with the transmission and drive gears in one lightweight package. You'll get up to 30% more miles to a gallon and -because this engine is air cooled—you'll never have to fuss with antifreeze.

Corvair's size—almost 5 inches lower, 2½ feet shorter, 1,300 pounds lighter than conventional sedans—makes it a joy to jockey through traffic and park in tight spots. Yet its unique Unistrut Body by Fisher offers plenty of room for 6 broadshouldered passengers. And, thanks to Corvair's rear engine, the floor is practically flat, front and rear, so there's generous foot room. Shifting engine weight to the rear also adds extra ground-gripping traction and gives better compact car

handling and braking. And with independent suspension at all 4 wheels, Corvair rivals much more costly cars in the poised, unruffled way it rides.

A price your budget will appreciate. Wonderfully practical as all these advances sound, you'll find the most practical thing about this new Corvair is its price. Make it a point to visit your Chevrolet dealer soon—and see what a wealth of engineering a modest amount of your money buys! . . . Chetrolet Division of General Motors. Detroit 2, Michigan.

THE FLOOR IS PRACTICALLY FLAT—Trunk's up front. Lightweight rear engine is world's first production 6 with ultra-smooth power of horizontally opposed pistons. Pure and simple as modern architecture. THERE'S NOTHING LIKE A NEW CAR—AND NO COMPACT CAR LIKE THE CORVAIR ... by CHEVROLET!

T-Men's New Tricks Trap Bootleggers [Continued from page 94]

tailers. The most glamorous specialists—
though not necessarily the best paid—
are the delivery men. The T-men refer to
them as "transporters." They haul corn
likker in fruit jars or five-gallon cans (the
kind varnish comes in) from the still to
the wholesaler's drop. That's all they do,
just pick up and deliver.

Some transporters resort to disguise (a hearse, a kerosene tank truck), but most rely on horsepower and a sure feel for traction on narrow mountain hairpins.

The revenue agents chase them in police interceptors—Fords, Chevies or Plymouths specially equipped at the factory with power pack, husky generator and heavy-duty transmission—or occasionally a captured bootlegger vehicle pressed into government use. A few transporters return the compliment by driving police interceptors themselves (they get them somehow, even though interceptors supposedly are sold only to official law agencies).

But most transporters' hot cars are very hot (125 m.p.h. and more) and very individual. Until recently the preferred chassis was a '39 or '40 Ford or Chevy (inconspicuous, light and good on curves). Under the hood, however, there was nothing plebeian: shaved heads, racing cams, multiple carburetors and all the rest of the speed-shop paraphernalia. Some of these jalopies concealed Cadillac engines, a few Offenhausers (designed for the Indianapolis 500). One man tuned his car so delicately he would never drive it except on "business." He hauled it from the shop to his home on a truck, and took it back to the shop after each run.

Practice makes perject. Several of the Southern transporters pay their rent by hauling liquor, and pick up extra change in stock-car races—this provides both a cover for ownership of an outlandishly fast automobile and a chance to perfect driving techniques. All practice their runs, driving the route empty to see just how fast they can take each curve. (The Federal agents practice, too.)

Radios are another effective weapon against bootleggers—particularly handie talkies, which permit precise timing of a raid. It's easier to win a conviction if the moonshiners are caught in the act,

READY FOR A FLYING START

AS A U.S. AIR FORCE PILOT

The Air Force pilot is a man of many talents. He is, first of all, a master of the air—and no finer exists. In addition, he has a background in navigation, airborne electronics and engineering. Then, too, he must show outstanding qualities of leadership, initiative and self-reliance. In short, he is a man eminently prepared for an important technological future in the new Age of Space.

Find out if you can qualify for training as an Air Force pilot. Paste the coupon below on a postal card and mail it now.

Next time you see a carpenter, plumber, steam fitter, sheet-metal worker at work, take a look at his rule.

Ten to one you'll see a Lufkin Red End . . . and often it will be the handsome X-46, with 6" brass extension slide. Men who do quality work prefer quality tools. They like the old-fashioned character of a natural finish as used on the X-46 . . . the quality-look of gleaming joints and strike plates . . . the precision-look of sharp graduations. Pick up an X-46 at your hardware

store. One close look at it, and you'll want it. Buy it right then.

You'll find a world of LUFKIN measuring tools at your hardware store.

T-Men's New Tricks Trap Bootleggers and not just lounging around some vats. But occasionally all this modern gadgetry backfires.

One time, a Federal group leader crouched on a North Carolina hilltop, directing a raid on a backwoods still. When the time was ripe, he radioed, "Hit it." His men moved in for a clean sweep. exactly as scheduled.

What he didn't know was that, at the same moment hundreds of miles away in Chicago, another crew of agents was deployed around a warehouse known to conceal an alky still. Their ears were glued to handie talkies, too, waiting for the attack signal. By one of those freaks of radio propagation that send short waves skipping across abnormal distances, the Chicago men heard the North Carolina command. They broke into the warehouse an hour too early, seizing the still but missing the gang they had so carefully planned to trap.

The bootleggers keep up with the times, too-airplanes, speedboats, twoway radio and all the rest. Recently, after newspapers reported a delicate chemical analysis that showed which ingredients give whiskies their distinctive tastes, the research team got a letter from a man in Texas. He'd been in the bootlegging business for 50 years, he said, and wanted to buy some of that bourbon flavor-he had the rye problem pretty well in hand.

Such concern for palatability is unusual. In the South cracked grain (chicken feed, for instance) is cooked with yeast in open vats. The starch ferments to sugar, and the sugar ferments to alcohol. After five to seven days (depending on how much store-bought sugar is added) this mash is boiled in a big pot and the vapor condensed (occasionally by running it through an auto radiator). The product is moonshine whisky of undeniable potency-90 to 100 proof. Flavor is something else again. Nobody bothers to fish out the bodies of squirrels or dogs that accidentally fall into the vats.

Northern bootleg--made by multiple distillation of fermented sugar in costly and complex column stills—doesn't have any flavor at all. What comes out is almost straight alcohol (180 proof). The customer dilutes and flavora it himself

T-Men's New Tricks Trap Bootleggers (generally with fruit juice or soda pop).

This dependence on sugar—it takes 100 pounds to make six gallons of alky is a major reason the bootleggers have been having such a rough time lately. A law passed recently gives the tax men control over the raw materials that the bootleggers might use—mainly that means sugar. Sugar dealers can be required to report sales. Most dealers have always cooperated, but there are a few operators who "forget" sales, and the law puts a stranglehold on them. Today, anybody who buys a load of sugar had better be ready to prove he makes candy or cookies out of it.

If you get the impression of a polite game between tax agents and bootleggers played according to established rules. with little more personal animosity than appears in high-school football—you're partly right. The agents reminisce about the 95-mph chase that was interrupted when the revenoper rolled on a curve The transporter he was after stopped and came back to see if anybody was hurt. Then he bargained for a headstart—and helped get the government car on the road again

Yet all is not chivalry. Bootleggers north and south are racketeers making a fast buck outside the law. The estimated

take: \$3,000,000 every day.

Chief T-man John Lathern says, "Six organized mobs are now active on the East Coast. Their chief income is derived from illicit alcohol." The tie-up with other crime—bookmaking, narcotics, white slavery and hired murder—is certain, although seldom provable in court.

The comic-strip image of the South's rustic corn-squeezers is largely a myth, too. Actually, much of the moonshine output, even in the hills, is organized into combines and managed by executive types who are no more country bump-

kins than is Johnny Dio.

The bootleggers play by the rules when meekness is smart. But like the rest of the underworld, they are also wise in the uses of bribery, extortion, kidnaping, ar-

son and the one-way ride.

The Alcohol and Tobacco Tax Division agents share with immigration officers the tragic honor of losing more men "killed in line of duty" than any other Federal police.—Martin Mann

New Burners: Smaller, Hotter, Chesper

[Continued from page 132]

to as low as 125 degrees and by leaving practically no burnable products in the flue gases.

Jet-style heating. An improved Jet-Heet furnace, just licensed for distribution by BTU Industries, Inc., Englewood, N.J., works on the principle of a jet airplane engine. It, too, requires no chimney draft, and is designed—codes permitting—to take a Type B vent. Its strong points are compactness, ease of installation, lower cost.

It heats one-quarter the usual volume of air, but stokes it up nearly four times hotter than regular furnaces. It sends the air through tiny two-inch insulated hoses.

At the delivery end, the super-hot air is blended with room air to produce the desired temperature and volume. It doesn't need return air lines.

The Jet-Heet system has been tested in 2,000 home installations, was used in Antarctica by the Navy, and is now being sold to drive-in movies to supply both heating and, by means of a companion unit, cooling. It's a furnace package equally well suited to new homes or remodeling.

Makes its own draft. A new furnace by Iron Fireman has no blower in the oil burner, nor does it depend on natural chimney draft. Factory-adjusted for maximum efficiency, it never needs readjustment, according to the maker. A fan in the heat exchanger provides a precisely controlled flow of combustion air under all conditions.

Combustion is so much better from the instant the burner starts that smoke and soot are completely absent. Flue temperature is a good 200 degrees cooler than standard and there is no heat loss up the chimney due to uncontrolled draft during burner standby periods.

Initial cost of the furnace is higher, but you'll save on installation and probably on chimney costs in a new house. Savings are said to be a third on fuel, even more on service.

A quieter burner. Flame pulsation, that familiar throb you hear from oil burners, has long plagued the industry. No one—until now, at any rate—seemed to understand its causes. Burner servicemen use various makeshift remedies—

New Burners: Smaller, Hotter, Cheaper an intentional air leak around firebox doors, excessive draft, reduced firing rates —but these waste fuel and often aren't effective.

A new burner by Hart Heat, Peoria, Ill., is said to have the problem whipped. The designer, Earl K. Smith, says he has found the exact cause of the trouble: Conventional burners spray oil from the nozzle to produce one flame shape, then blast air into the gun tube that tries to make a different shape. The noise is the sound of battle in the firebox for control of the flame shape.

The new burner gives complete control to the nozzle and sneaks in the air in such a way that it can't start a fight. Result: quieter operation, no odors, less nozzle plugging, improved efficiency. The new burners are being offered as replacement units to fit almost any furnace.

Cheaper hot water. New oil-fired water heaters can deliver hot water faster than competitive heaters. They cost less to operate, too—reports claim up to 70 percent less than electricity, 40 percent less than gas. The initial cost is likely to be higher—\$50 to \$100 more. They require a flue, but it can be the same one the furnace uses.

These water heaters are not to be confused with pot types burning kerosene. They are gun type, employing burners like those used in most oil furnaces.

The hot-water output of even the smallest oil-fired unit is enormous. A 30-gallon tank size will turn out 30 gallons of 100-degree rise water every 15 minutes.

Electricity at half price? It may be a practical reality sooner than you think. More than half the present cost of electricity lies in the expense of transmitting it from the power plant to your home. By producing your own, you'll be able to rout the meter reader, save the difference. A 20-hp. oil-fired gas turbine will turn your home generator quietly, reliably, economically.

The vital components needed for a home generator already exist in perfected form: 1) the small generator, 2) the efficient heat exchanger, 3) the small turbine. All that remains to be done is to bring them together. When the turbine price is right, it will be done. Experts say it's not more than five years away, perhaps much less.

Taming the Mad Mountains

[Continued from page 136]

and climate, the engineers can secure an enlightening picture of the slide danger. When they do, the time has come for action. This now is aimed at doing what once seemed impossible—stopping the slide before it starts.

New approach. The Highway Research Board of the National Research Council has recently issued a compilation of land-slide information. It includes the results of years of experiment and investigation on the control and prevention of slides. It reports many measures that today are proving highly effective in holding dangerous slopes.

Ground water, the experts say, is the most important cause of slides. It lubricates the rock layers. Removing this water with drains, tunnels, wells, and continuous siphons prevents trouble.

Portland, Ore., once built two concrete-lined reservoirs on a clay slope. Cracks in the concrete soon showed that the entire slope was slowly sliding downhill. When engineers drilled tunnels to drain off ground water, sliding stopped.

It isn't always that easy. Steps often have to be taken to hold back the slide itself, a seemingly gargantuan task. In some places, however, crib walls, pilings, and bulkheads are proving remarkably useful. Buttresses at the foot of some potential slides help prevent them from moving farther. Dowels, or rock bolts, can pin a slope directly to a mountainside.

One of the most effective methods, especially on turnpikes, is the bench—a protective shelf dug back into a road-cut to catch incidental debris before it falls on the road or passing cars.

Last resort. If even these do not work, the engineer may remove the slide completely, remove part of it, or bridge over it and let it slide.

Japanese engineers have even rigged landslides to set off a warning before breaking loose. Strain gauges indicate when a slope is nearing the breaking point. And U. S. railroads have devices that warn when slides have occurred or are in progress. These connect to automatic block signals to slow a speeding train in time. Perhaps these two schemes will someday be combined to reduce still further the danger of a rampaging mountain crashing down on passing motorists.

You do the choosing! The Army's new "Chooseit-Yourself" System lets you pick valuable training before you enlist. Here's how it works

- 1. Choose before antistment. Choose your training from fields the Aircraft Maintenance. Radar and TV Repair. Drafting, Atomics, Printing—and many more.
- Qualify before enlistment. Take aptitude and physical exams to qualify for the training you've chosen.
- 3. Knowbefore enlistment, if you qualify, you know you'll get the training you want. Your choice is written into your future Army record—guaranteed before you enlist.

Choose quality, know—this week Ask your Army recruiter to show you his complete list of available training fields.

Want training in Aircraft Maintenance? Communications? Engineering?

CHAMPION DEARMENT TOOL COMPANY
MEADVILLE, PENNSYLVANIA

ASK YOUR TOOL SUPPLIER FOR GENUINE CHANNELLOCK PLIERS

Good Eyesight in a Home Shop [Continued from page 177]

If you have to wear bifocals some day.

Glasses are a tool, as important as any other tool in your shop. If you wear glasses, be sure they do the right job for workshop use.

Measure your actual working distance. The average critical seeing distance is 16" to 18", but individual arm length and posture make a difference. Fine finishing and construction work may be done as close as 11" to 12", while for other jobs good vision is necessary from 22" to an arm's length away. When you have your eyes examined, be prepared to explain exactly what your needs are.

Glasses can be designed to do any specific job, but they may not meet every seeing need once the bifocal stage has been reached. For some eyes it may take several types—possibly trifocals or a specially designed double bifocal with a section at the top of the lens for reading on overhead shelves. Some hobbyists prefer single-vision lenses with an intermediate focus for general work and another pair for closer-than-average seeing.

Protect your eyes, Do-it-yourself fans run a greater risk of eye injuries than experienced workers. High-speed machines are always a source of danger from flying objects, but hand tools can also send a chip of wood or metal into the eye,

Simple plastic shields, worn over regular glasses, can provide inexpensive protection. Safety goggles made of glass or plastic offer even greater protection. Your regular prescription lenses can also be made in safety form.

The person who wears ordinary glasses is in more danger than one who wears none. An inch from the eye is an easily shattered lens that can send a sliver of glass into the eye.

Give your eyes a rest. Most home-shop work comes at the end of a day's hard work or is crammed into a weekend. This kind of concentrated and prolonged effort causes fatigue, which lessens efficiency and jeopardizes safety.

Rest your eyes occasionally. Get up and walk around. Change to another job requiring different use of the eyes. Look up from close work every 15 minutes, shut your eyes for a moment and blink a few times. Your work will go better and faster if you relax now and then.

Seven ways to save the life of your battery this Winter

Cold weather is rough on your battery. At 32°F, even a fully-charged battery delivers only 50% of its power! At 0°F, only 40%.

1 Starting causes the most drastic drain. So, before you start, be sure all electrical units — lights, radio, heater, etc. — are off.

2 If your car has a manual shift, be sure it is in neutral and depress clutch. Avoid flooding engine by pressing accelerator clear to floor once, then engage starter.

3 If engine doesn't start, check gas supply. In damp weather, wipe off spark plug porcelains with a dry rag. Then try it.

4 Cold garage? Not using your car often during extreme cold weather? It will pay you to buy an inexpensive trickle charger. Hook in overnight as required.

Best plan for cold weather: have your battery looked at, at least every 2 weeks, by your Texaco Dealer. He will check water level, test, and re-charge if necessary. This may save the life of your battery.

6 Keep terminal clamps clean. (Every time you have a Texaco hall Safe-T check-up, your Texaco Dealer will remove corrosion and protect with coating of Marfak.)

7 Take the cold-weather load off your battery and engine by keeping crankcase filled with Havoline Special 10W-30. This is the all-temperature motor oil that stays freeflowing, prevents cold-starting wear (with less drag on your battery)

 prevents harmful varnish, sludge and deposits.

Buy the best ... buy TEXACO

Old-Timer's Wood-Finishing Formula

[Continued from page 201]

lution will show the greenish-yellow film of patina in a few weeks or months, depending on the wood. This is the beginning of the mellowing process, although, of course, the aging is artificial. Frequent rubbing down with a dry cotton rag is an excellent substitute for use. An additional application of the solution after a few weeks can be beneficial

In from two to 10 days (depending on the hardness of the wood) after applying the potash solution, apply the first coat of the final finish. This consists of equal parts of a good grade of clear spar varnish, kettle-boiled linseed oil, and turpentine—preferably distilled spirit of turpentine. Raw linseed oil is not a drying oil, and is not suitable in this mixture. The turpentine is a thinner. If the mixture seems too heavy, add more.

Rub this mixture into the surface of the wood with a well-washed cotton rag free of lint, such as an old shirt; new cloth is not suitable because of lint.

Dip the cloth into the developing mixture, then squeeze it out until it doesn't drip. Rub the wood briskly with the saturated rag, and watch the figure and colors appear, sometimes so quickly that they seem to jump at you. As the rubbing proceeds, replenish the rag as needed.

When the mixture has been rubbed in thoroughly, squeeze the rubbing rag as dry as possible and rub down the surface until it looks dry. This application may be repeated in a few days if desired, after removing any excess varnish with fine steel wool. Always remove all excess varnish—that which was not rubbed into the wood—before applying wax, the final coat of the finish.

For this, use good floor wax. First, however, be sure that the wood surface suits you, for nothing will follow wax. The first two or three waxings, several weeks apart, should be paste wax, rubbed in thoroughly. Thereafter liquid wax is good if preferred.

Rub, rub, rub. Note that I stress that all the finish is to be thoroughly rubbed into the wood. This is important. Any residual oil or varnish detracts from the finish. The clear spar varnish and wax, neither of which colors, are ample filler. The surface presented by the finished job is natural wood in its natural colors. The

2 NEW SKIL POWER SAW VALUES!

SAWS 2x6 BOARD IN 14 SECONDS!

The Skil Jig Saw is fastest—cuts anything from wood to steel, any shape from straight lines to circles.

Use the Skil Jig Saw with ease for cutting 2" boards, plywood, plastics, metal, other materials. Veteran power tool user or beginner, you'll get professional results.

With Skil's orbital cutting action, the blade cuts on the upstroke, moves away from the work on the downstroke to eliminate blade drag. That makes it the fastest cutting jig saw on the market.

This Skilsaw 6 1/2" Power Saw has a rugged 1+ h.p. motor to handle all cuts faster... with greater accuracy. Special features include non-binding lower blade guard and safety clutch, which disengages the blade if it jams or binds. Also has easy-to-adjust depth and bevel controls for accurate 45° to 90° cuts.

In short, there are more professional features on this Skilsaw Model 536 than any other saw in its price class.

See your hardware or lumber dealer today and try these two saws. You'll quickly recognize them as outstanding values.

One extra combination blade plus accurate rip guide with this 5½° Model 536 Saw —all for only \$49.95. Hurry! Limited time offer, at most Skil Dealers.

.. AND SKILSAW POWER TOOLS

Skil Corporation, Chicago 30, Illinois. Prices higher in Canada.

AUTO-LITE RESISTOR SPARK PLUGS WITH POWER TIP

Old-Timer's Wood-Finishing Formula number of colors present in ordinary woods is pleasantly surprising.

Application of the developer coat (which is not a coat at all, as all of it goes into the wood) has no effect on the formation of the patina film. It neither stops, retards, nor accelerates this formation, which can soon have as great a value as the item on which it forms: It enhances the beauty already brought out by the finish.

Adding color. It often happens that two kinds of wood are used together, one much darker than the other. If desired, a small amount of dry powdered umber may be added to the potash solution for the light wood. Raw umber is yellowish brown. Burnt umber is reddish brown. Either of them will add color to light wood and will appear as natural color, not as stain.

Wonderlux wood finish improves with age on any interior woodwork, be it furniture, walls, floors, or whatever. The only attention it ever needs is to be lightly waxed every year or so. Frequent rubbing down with a dry cotton rag improves it. Walls, furniture and other woodwork I finished years ago are now more beautiful than ever.

Nearly all fir plywood presents a gorgeous, interesting display of fine-grain figure. The surface ply is actually rolled off the log as paper is taken from a roll. This multiplies the grain figure many times over. Although the raw wood presents only two colors, Wonderlux brings out unseen colors in dozens of delicate shades. Very few sound, tight knots are found in plywood. These are usually very small, but also very beautiful, and well worth special care to preserve them. No other wood figure actually stands out as the hard red grain of fir plywood stands out from the soft grain.

Handling knotty pine. Knotty-pine paneling has long been popular. Finish it in Wonderlux and the pine comes to life. Each knot becomes a masterpiece; more so if care is taken to install the boards butt ends down, as they grew.

When possible the boards should be cut to length, treated with the potash solution, and, after two or more days, lightly sanded and rubbed down with steel wool to remove the raised grain. Then give one coat of the color-developing mixture

Old-Timer's Wood-Finishing Formula to bring out the grain figure and all colors and shades of color in each board. It is then possible to arrange the boards for the most artistic effect. Leave the final applications of the finish until after the boards are in place.

Since the main ingredient of Wonderlux finish is water, which must be absorbed by the wood, the refinishing of old wood requires that all old finish be removed, preferably by scraping. But scraping removes and destroys any patina which may have formed on the surface, leaving practically a new surface.

If the item to be refinished is old enough for its age to give it value, the old finish should be removed with a good grade of paint and varnish remover. If a wood part of an antique is to be replaced, the replacement part can be aged with the potash solution.

Surprising things can happen with Wonderlux, and anyone intending to use it should experiment in a small way to get acquainted with the possibilities.

Even after nearly 45 years of continuous use of Wonderlux, it is impossible for me to impart on paper a real knowledge of the finish. I find that my ability to write about it is far below my ability to use it. But I hope that all readers will get the pleasure from Wonderlux that I have had.

Cleat Guides Square Cut

When cutting a board to a squared line is a critical problem, I nail a cleat with the outer edge directly on the line. Sawing snugly along this temporary guide, I get an accurate cut, and then pull out the nails. Where nail marks are objectionable, clamps will hold the cleat.

—Michael Liggett, Gary, Ind.

Hole to Probe Inside the Earth

[Continued from page 89]

Formerly the crust on which we dwell was thought to be the only solid part of the earth—a thin film of alag floating precariously upon a worldwide sea of molten lava. Today that rather alarming notion has been discredited. Refined modern techniques of sounding the earth's depths, by observations of earthquake waves, give a different picture

In the latest view, the crust rests upon an 1,800-mile-deep foundation of solid rock, the mantle. Then come the earth's molten outer core—probably of iron and nickel, though possibly of some novel pressure-created mineral—and a solid inner core of the same material, unable to melt at the extreme pressure near the earth's center.

Discovery of the solid mantle, relatively a newcomer to our picture of the earth's interior, has called for defining just where the crust ends and the mantle begins. Earth scientists have adopted the Moho as the dividing line. It's a logical one because a sharp change in the nature of the rock occurs at the Moho. as is indicated by an abrupt increase in the speed of earthquake waves just below

What lies in the mantle? Temperatures in deep mines and wells, rising about one degree for every 100 feet of descent, hint of a veritable inferno not far below. The earth's rock glows with red heat at a level perhaps no deeper than 30 miles, and becomes white-hot farther down. Fortunately this heat wells up so slowly, through the insulating crust, that it isn't even noticeable to us at the surface—amounting to only 1/25,000 of the heat beating down from the overhead sun.

Fantastic pressure in the mantle, comparable at 650-mile depth to the impact of a screaming shell on armor plate, not only may create unknown minerals. It may make the mantle literally diamondstudded. The pressure becomes enough to form the gems at a depth between 80 and 120 miles, one scientist calculates.

From the solid mantle must come the fiery lava that volcanoes spew forth. What melts the lava? Probably rock down there is almost hot enough to melt, despite the raising of its melting point by pressure. So just a slight relief in the pressure, as blocks shift in the earth's

Hole to Probe Inside the Earth

creaking crust, could allow the rock to liquefy and form a lava pool. Or the energy of earthquakes only partly dissipated in seismic waves-may locally generate enough heat to boost the rock's temperature to the melting point, Which of these rival theories is right, if either, has still to be learned.

The deepest earthquake known took place 446 miles below the surface. That's the deepest, scientists conclude, at which the mantle's rock is brittle enough to fracture and cause a quake. Below that, they think, heat and pressure make the rock plastic, and capable of flowing. If you could bore a hole that far down and then withdrew the drill, the hole would slowly close up again.

On that puttylike underpinning, is it possible that the earth's whole surface. the entire crust and the upper part of the mantle, could skid about crazily? There's strong evidence that the awesome event has actually happened, repeatedly,

in the earth's history.

Shifting poles. Seemingly the North and South Poles weren't always where they are now. Coal beds, leaf fossils, and petrified trees in Antarctica show that it once was tropical. Magnetic studies of ancient rocks appear to provide a detailed record of no less than five major shifts in the poles' locations during the last 600 million years. Illustrations accompanying this article show the poles' supposed travels, and how the skidding of the earth's superstructure could have caused them—as, by this theory, it may some day do again.

These are some of the things we know. or think we know, from indirect ways of investigating the earth's insides, Mohole will permit checking these surface-based observations against direct ones. Then seismic and other indirect methods can be applied more confidently, and accurately, to plumb depths still

beyond reach of drilling.

This country's Mohole project may not be the only one afoot. Russian scientists, it's reported, say they have the needed equipment and that they, too, are looking for a favorable site. So a dramatic international race to the mantle may be shaping up. If st., declare the U.S. planners, they'll welcome it-the more Moholes, the better.

TRY Dragon-Skin

Thousands of tiny cutting edges punched into thin sheet steel make a marvelous look that "sands," and "rasps" wood, plastics,

soft metals swiftly, easily, and absolutely without elogging. Just 75¢ on bolder as abown; replacement sheets for a quarter

Red Devil Glazier's Chiact, a heavy brute that's the only easy way to clean out hard old putty \$6.75 to \$8,00 depending on which of 5 sizes you pick.

In cut circles in glass, glass shops use one of 5 different models of Red Devil Circle Glass Cutters. If 2"-24" diameter gives you enough intitude, you can get a dandy for \$5.00.

You don't have to hop mechinery to keep your floors beautiful. Thousands of dealers are ready to rent you a Red Devil Floor Polisher for around a dollar a day and to sell you one if you like it for an little as \$54.95

It's always heat to buy where Red Devil Toom are sold, for wider choice, top quanty, correct "how-to" advice.

Free hooklet, "How To Cut Oloss."

Home-workshop sculptor

ROTARY files and sanding drums are mounted here in a standard drill press by Chaim Gross, New York sculptor, to carve a figure from mahogany. He uses the drill for pet workshop projects, too,

Coal in returnable cans

In Parts of France where stoves are in common use, the companies deliver the fuel in convenient 33-pound cans—like milk in bottles. The cans, clean and shaped for tipping, replace the old scuttles.

Trap household odors and dust... SAVE MONEY, too!

FURNACE FILTERS

Economical because they're WASHABLE. As easy as rinsing a dish... collected dust, dirt, pollen and water soluble adhesive flush off with water.

> Amazing adhesive REMOVES ODORS, DUST...Super Filter Coat adhesive, in two types of spray containers, traps and holds odors and dirt...has built-in detergent to simplify washing. Restores like-new efficiency to filter.

Long-lasting ALUMINUM won't rust, makes cleaning easier...lasts for years and years of clean filter service... and improved furnace operation.

MECHANIC'S FAVORITE!

Here's the number one choice-

It's the Hunt Model 100 DeLaxe Chest—custom designed for mechanics who want the finest protection plus maximum accessibility for fine tools. Eleven drawers - seven of them corklined for protection. Three heavy-duty drawers for large tools—1 extra deep drawer for power tools. Single latch locks entire enhinet. Two-tone tilresistant finish. Free bulletin describes 12 tool chests.

HUDY MIG. CO.

532 No. Wheeler Street, St. Paul 4, Minnesota

South Hend's design climinates the major cause of inaccuracies common to all drill presses—spindle deflection resulting from depth gage pressure. There is no depth gage collar on the quill. Travel of the quill is controlled by an exclusive Rack Type Depth Gage that limits the rotation of the quill feed shaft. Write for more details about South Bend's exclusive features.

Prices of South Bend 14" Precision Drill Presses start at \$128 [.o.b. factory

Tunnel Diodes: Even Better Than Transistors

[Continued from page 145]

panting. Tunnel diodes don't care about temperature, working at 450 degrees below zero, 600 degrees above zero, and everywhere in between. They perk along merrily amidst the deadly bombardment of rays from atomic furnaces. They make excellent high-speed switches (for computer elements), 100 times faster than the transistors now used.

But it's the combination of low noise, high frequencies and low power at low cost that will shake up radio and TV.

More TV stations? Television, for example, is busting its buttons. There isn't room for all the TV channels people want. Today no area can have more than seven regular stations, and only the five largest cities are allotted that many. Putting more on the air would louse everything up with interference. This is an annoyance in New York, where many people want an "educational" channel. It's a real pain in the neck in places like Riverton, Wyo., which has one channel. People who live there take what that channel offers or go play checkers.

The way to make room for more stations is to move television up to higher frequencies that aren't so crowded. This was tried—UHF television—and flopped. The higher frequencies poop out after traveling a few miles. The areas these stations cover—and the audiences they collect—are so small that few have been able to compete with regular TV stations.

A low-noise amplifier would tip the scales the other way. By providing good reception on weak high frequencies far from the station, it would give such stations big audiences. Then they could make money. You'd see many more channels blanketing the country the way radio stations do now.

In one experiment (performed by an amateur on his own), the vacuum tubes were ripped out of a TV set and replaced with very-low-noise amplifiers of the parametric type. It delivered an excellent picture from a UHF station 100 miles distant. Tunnel diodes should work just about as well, better in some ways.

You can't buy them yet. General Electric is first to sell tunnel diodes (the ZJ56, engineering samples only), but RCA and Bell Laboratories are close behind, None of them invented it. They got

the idea from an inconspicuous short article in the January, 1958, issue of the Physical Review. Its author was brighteyed 34-year-old Dr. Leo Esaki, a physicist for Sony Corporation in Japan (Sony makes the excellent \$30 pocket radios widely sold here). The Japanese know a million dollars when they see it and have filed for a basic patent.

Esaki reported that a tiny sandwich of semiconductor materials—similar to a common rectifier—showed negative resistance. Increasing voltage caused current to decrease—the reverse of what happens ordinarily. There is the million dollars. With negative resistance you can build an amplifier (or oscillator or high-speed switch). The small change in voltage causes a big change in current. That is what an amplifier has to do: control a hefty current with a weak signal voltage.

Why it works so well. The tunnel diode exploits a strange electrical process called (surprise!) "tunneling." Electricity "tunnels" through a barrier which, without quantum physics, it could not pass. It's as if a current had jumped past insulation to get from one wire to another, even though the voltage were too low to make the insulation break down.

Tunnel currents, like ordinary currents in a wire, change with the speed of light. They are streams of electrons—an electron entering at one end pushing a different electron out the other end. Vacuum tubes and transistors are different. In them, a single electron has to travel all the way by itself. Single electrons move slowly (30,000,000 m.p.h., slow compared to the 670,000,000-m.p.h. speed of light).

High speed enables the tunnel diode to handle high frequencies, which are currents that change very rapidly. It also keeps noise low. The electrons in the stream are not kicked around individually to get in the way of the signal.

The tunnel diode is the newest magic to come out of the quantum physicists' awesome formulas. In the past decade these wizards of the blackboard have transmuted unlikely rocks to amplify electricity, generate electricity from heat or sunlight, and convert electricity into heat or cold or light.

Don't miss next month's miracle. It'll have to be good to top this one.

JYBC-XHB-Q2EE

Exclusive at Sears I Jewel-like hard chrome puts an edge on these tools that lasts 3 to 5 times longer than ordinary edges. You always get a cleaner, sharper thread cut with far less effort. 40-piece 17-cut set has up to ½ inch capacity and comes complete in a rugged plastic case that's unbelievably compact—takes 50% less room than wooden cases, weighs 5 pounds less! Buy now and save nearly a third! Only \$2 down on Sears Easy Payment Plan.

Cuts National Coarse (USS) threads $\frac{1}{4}$ -20, $\frac{1}{4}$ -18, $\frac{1}{4}$ -16, $\frac{1}{4}$ -14, $\frac{1}{4}$ -13; National Fine (SAE) $\frac{1}{4}$ -28, $\frac{1}{4}$ -24, $\frac{1}{4}$ -24, $\frac{1}{4}$ -20, $\frac{1}{2}$ -20; machine screw, 4-36, 6-32, B-32, 10-24, 10-32, 12-24; and $\frac{1}{4}$ in, standard pipe threads. 16 adjustable 1" dies: 1 solid pipe die, adjustable guide die stock, tap-and-reamer wrench, "T" tap wrench, screw pitch gauge and screwdriver. Case has two removable trays.

NEW QUADRI-BALANCED RIDE . . . the quietest ride you've ever tried!

For 1960, Oldsmobile brings you a new kind of ride comfort-balanced four ways.

Wide-Stance Chassis provides a wider, lower base
—gives a road-hugging, steady, stable ride.

 Guard-Beam Frame gives the protection of a steel framework around the passenger compartments; permits the body to be mounted directly on the frame; eliminates "outrigger" type attachments.

3. Nylon sleeves inside Olds shock absorbers wear less—together with new "constant-viscosity" shock absorber fluid, produce a smoother, better controlled absorption of all bumps and bounces.

 Vibra-Tuned body mountings insulate body from road noise and harshness—make the '60 Olds the quietest Olds ever!

See your local Oldsmobile Quality Dealer1

There's nothing like a new car...
make yours a Rocket!

... NEW BALANCE OF POWER!

Olds engineers solved the power vs. economy question with two new Rocket Engines for '60.

New REGULAR ROCKET Engine gives traditional Dynamic 88 "Go" on regular, lower-cost gas—standard on every Dynamic 88 model for '60. Owners save about a dollar bill every fill!

New PREMIUM ROCKET Engine for Super 88 and Ninety-Eight models, gets the most in spirited action from premium fuels. Develops 315 h.p.; 435 lb.-ft. torque. Multi-Jet carburetion; 9.75-to-1 compression.

Porter-Cable ALL-PURPOSE SANDING KIT

The most versatile sander you can own. The Porter-Cable Beit Sander not only gives you "Professional finishes"—fast...it is a real time-saver for heavy stock removal, fine cabinet work, home remodeling, paint and varnish removal, boat work, rubbing, polishing, sharpening, grinding, etc. A really professional quality tool for the homecraftsman and hobbyist.

Ideal for sanding broad surfaces.
With correct abrasive, sander quickly lits doors, storm windows, screens.

Quickly removes paint or varnish. With felt and canvas belts, it does a professional job of polishing and rubbing.

With Bench Stand, sands curved edges, small or difficult pieces. Also sharpens knives, chisels, cutting tools.

All this for only \$5995

Porter-Cable Model 165 Belt Sander with 7' 3-conductor cord, No. 1/0-A Grit Abrasive Belt, Canvas Belt for rubbing, Felt Belt for polishing, four special compounds for rubbing and polishing. Bench Stand with mitre gauge, "The Finishing Touch"—big illustrated sanding booklet.

new 75hp STARFLITE

JETSTREAM DRIVE breaks the "drag barrier!" Just as jet planes changed shape as increased power boomed them to supersonic speeds...so has the Starflite II lower unit evolved into a new shape to translate its 50% greater power into higher speeds.

More than speed alone! Starflite II delivers a new kind of performance... high thrust at all speed ranges, under all loads. Its smooth, balanced V-4 engine pours out 75 horse-power. Jetstream Drive delivers its high thrust with high speed efficiency... without sacri-

ficing control. Its fin-slim gearcase houses full gearshift transmission. Here, for the first time, is a true high-speed lower unit with the safety and pleasure of complete automotive-type gearshift control.

Starflite II with Jetstream Drive is today's top-performer for skiing, cruising and big family-size runabouts. Best of all, you can own it at the lowest cost per hp in history! See it at your Evinrude dealer now!
